Jane Lockshin

# JISEA's Sustainable Communities Catalyzer

**Advance understanding of social, economic, environmental, and land use impacts of clean energy transition and map pathways for sustainable, equitable transitions, with a focus on rural and disadvantaged communities**

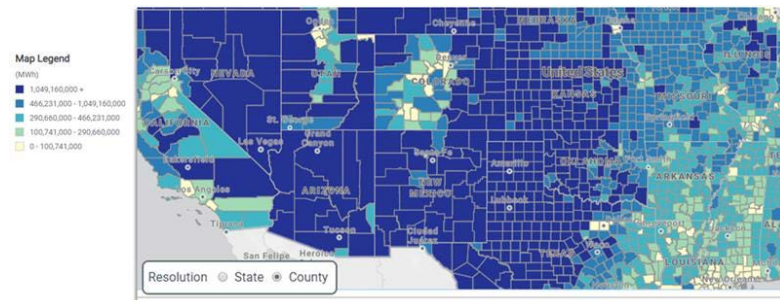

Lead PI: Megan Day

**Importance:** Scaling clean energy integration, electrifying economies, and transforming energy systems will have major impacts on land use, economies, people, and the environment. NREL is uniquely positioned to apply and integrate world-class modeling, visualization, and computation capabilities to sustainable communities' analysis. *NREL should lead quantitative analysis on impacts and opportunities associated with attaining subnational clean energy transformation and sustainability goals across multiple sectors.*

## Success Metrics:

- Codify research needs in coordination with NREL Directorates and partners
- Engage with external practitioners and researchers to include NREL in this community of practice and provide a feedback mechanism for NREL sustainable communities work
- Publications on thought-leadership analysis
- Incubate a Clean Energy Communities group to build capabilities and train existing and new staff in evidence-based best practices in engaging with communities on equitable clean energy planning

**Aligns with NREL's strategic plans in** Integrated Energy Pathways and Electrons to Molecules; Administration prioritization of climate and environmental justice

# Sustainable Communities

## Sustainable Communities

means attention to people, profit, planet and just and equitable energy transitions

*What are the community-level impacts and **opportunities of clean energy transitions?***

## Focus communities:

- Rural communities
- Disadvantaged communities

# Equitable Energy Investment Prioritization Research

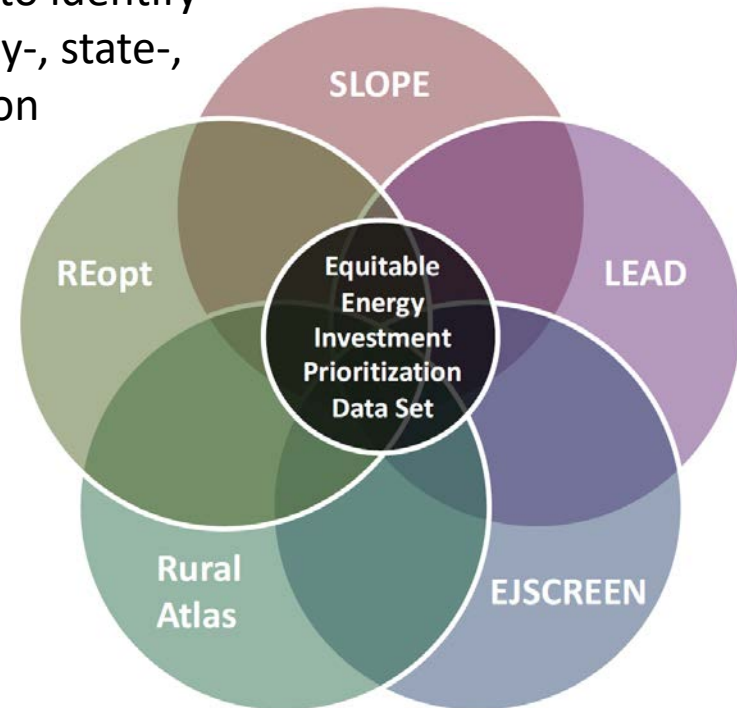

Goal: Intersect **disadvantaged community (DAC)** metrics with **renewable energy (RE) deployment potential metrics** to identify local clean energy opportunities and inform community-, state-, and national-level clean energy investment prioritization

## Data set to aid in analysis

- “Equitable Energy Investment Prioritization” data set
- *Published in NREL’s Data Catalog*
  - <https://data.nrel.gov/submissions/175>

## Paper with initial analyses

- “Intersections of Disadvantaged Communities and Renewable Energy Potential: Analyses to Inform Equitable Investment Prioritization”
- *Publication pending- submitted to journal on 9/1/21*

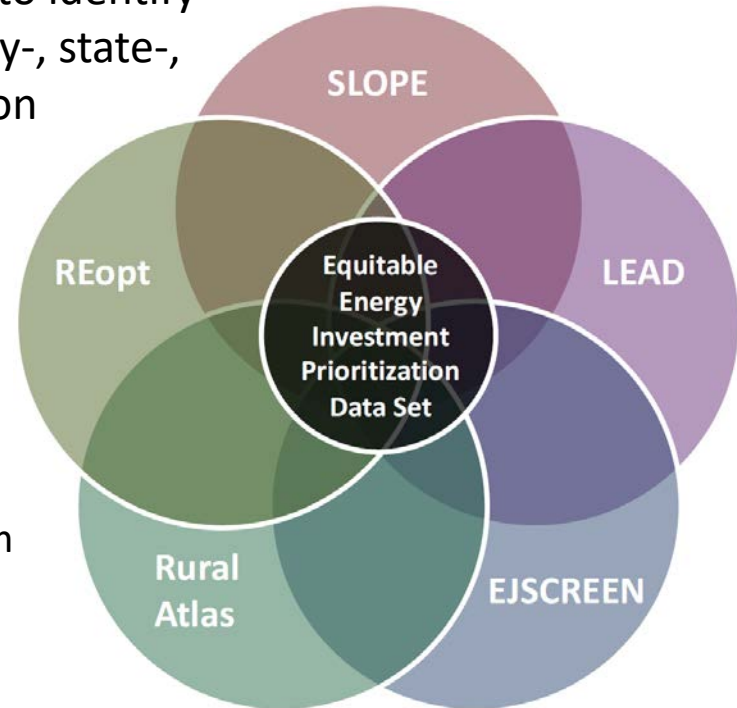

# Equitable Energy Investment Prioritization Research

Goal: Intersect **disadvantaged community (DAC)** metrics with **renewable energy (RE) deployment potential metrics** to identify local clean energy opportunities and inform community-, state-, and national-level clean energy investment prioritization

- **Top-down** applications
  - Identify broad patterns across RE and DAC metrics
  - Guide investment that prioritizes DACs
- **Bottom-up** applications
  - Provide communities with information to help them identify their needs and their comparative potential for RE development

# Equitable Energy Investment Prioritization Research

Goal: Intersect **disadvantaged community (DAC) metrics** with **renewable energy (RE) deployment potential metrics** to identify local clean energy opportunities and inform community-, state-, and national-level clean energy investment prioritization

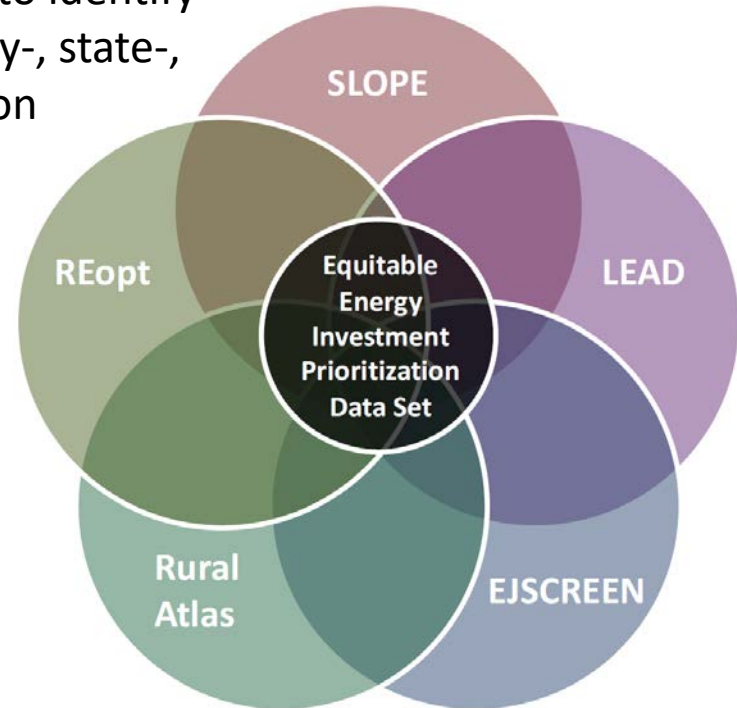

**SLOPE**: State and Local Planning for Energy platform

**REopt**<sup>®</sup>: Renewable Energy Integration and Optimization model

**LEAD**: Low-Income Energy Affordability Data Tool

**EJSCREEN**: Environmental Justice Screening and Mapping tool

**Rural Atlas**: Atlas of Rural and Small-Town America

# LEAD: Energy Burden

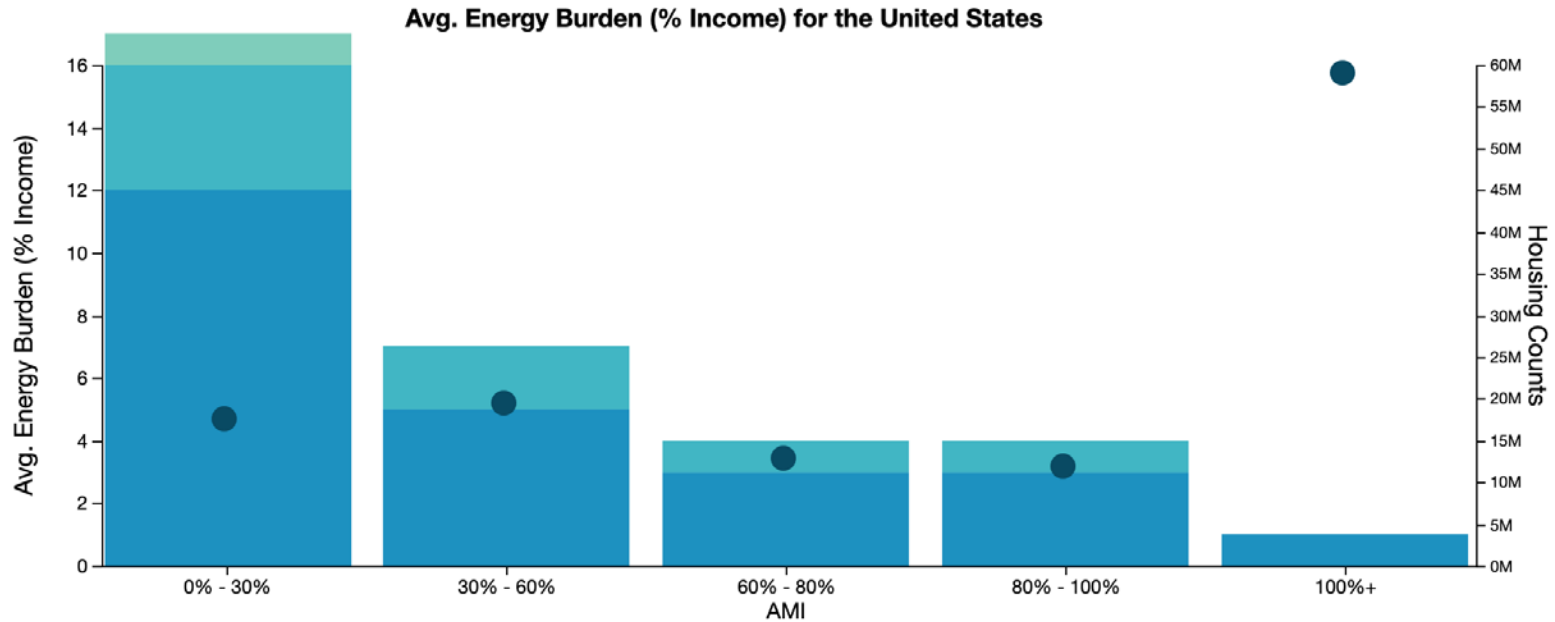

**Energy Burden:** the percentage of household income spent on household energy costs.

Households spending more than 6% of gross annual income are typically considered energy burdened.

# Utility PV: Modeled Annual Technical Potential

In eastern Colorado, technical potential for **utility-scale photovoltaic (PV)** is among the highest in the nation.

Modeled Annual Technical Generation Potential - Utility PV

(MWh)

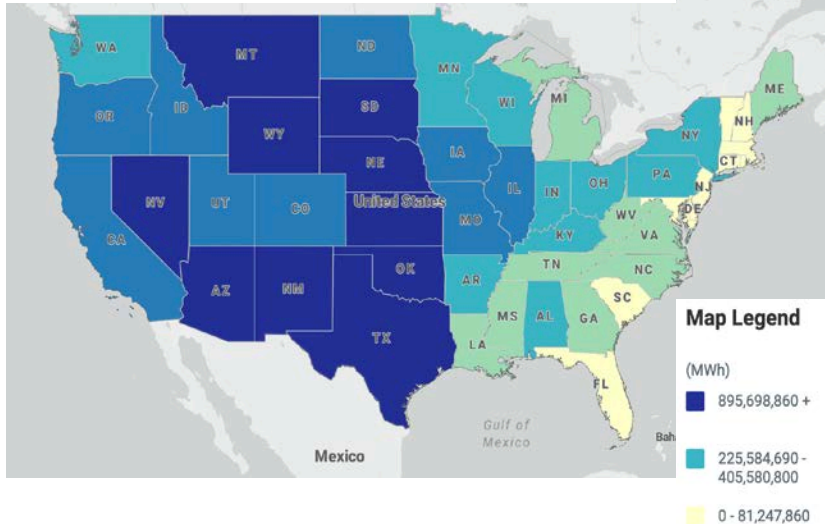

Note: Utility-scale PV generation potential is estimated using the Renewable Energy Potential (reV) Model based on single-axis tracking, 20 MW capacity systems, with performance and pricing characteristics in line with a 1.34 DC-to-AC ratio or inverter loading ratio, consistent with [Annual Technology Baseline](#) representative technology.

# Land-Based Wind: Modeled Annual Technical Potential

In eastern Colorado, technical potential for **land-based wind** is among the highest in Colorado and high compared to the nation.

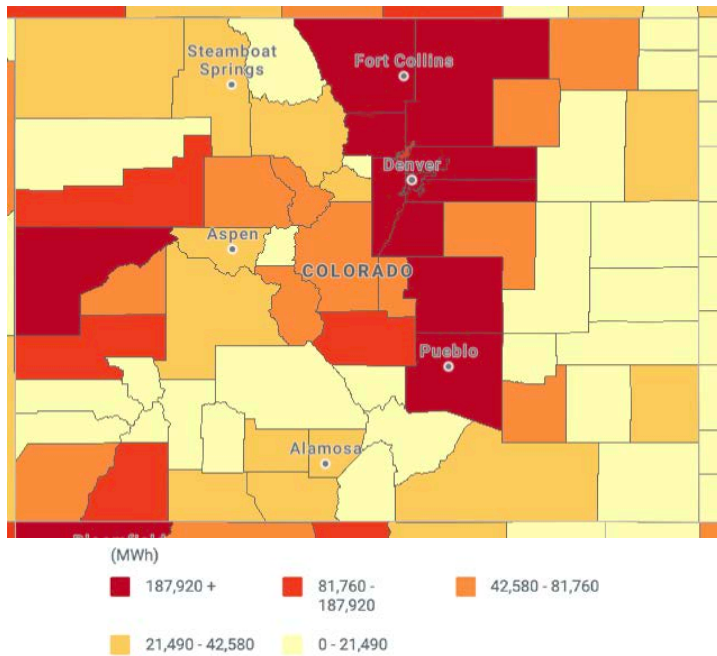

Modeled Annual Technical Generation Potential - Land-Based Wind

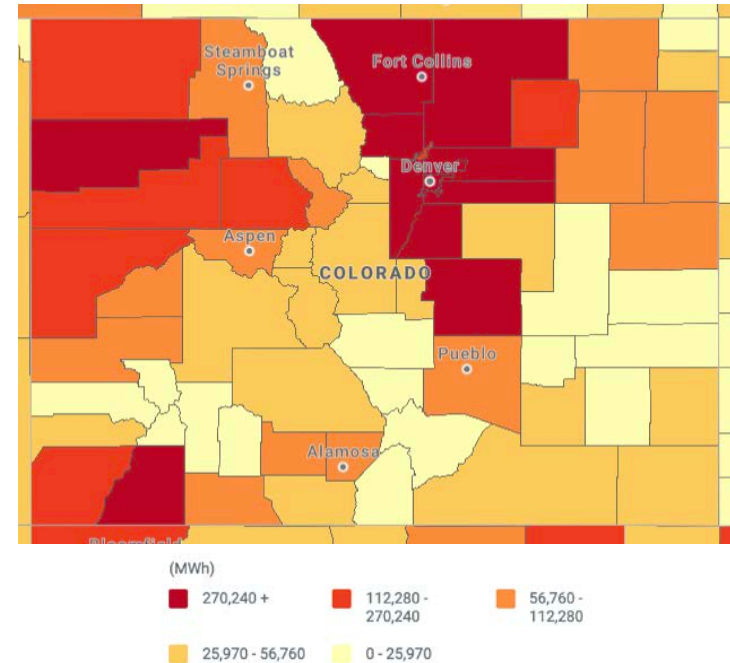

Note: Land-based wind generation potential is estimated using the [Renewable Energy Potential \(reV\) Model](#) and reflects representative technology consistent with [Annual Technology Baseline](#) assumptions.

# Rooftop Solar: Modeled Annual Technical Potential

## Residential Rooftop Solar

## Commercial Rooftop Solar

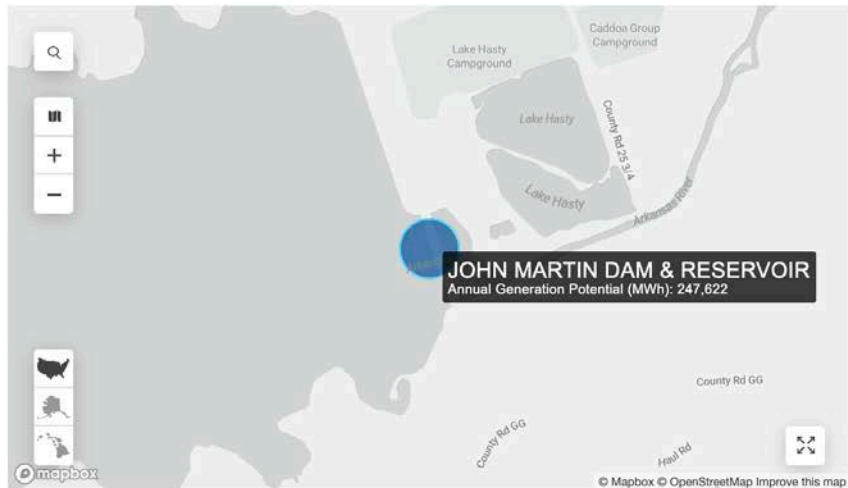

*NOTE:* The technical generation potential of residential and commercial rooftop PV is estimated by combining modeled suitable rooftop area with solar resource availability and quality and system performance data through a methodology described [here](#). Technical potential does not account for existing systems and does not consider economic or market feasibility. Additional solar information resources are available [here](#).

# Hydropower: Modeled Annual Technical Potential

## Bent County, CO

### Hydropower - Non-Powered Dams

### Hydropower - Non-Powered Dams

| Month     | Generation Potential - MWh | Capacity - MW |
|-----------|----------------------------|---------------|
| Annual    | 247622                     | 79            |
| January   | 10192                      |               |
| February  | 9162                       |               |
| March     | 12060                      |               |
| April     | 16896                      |               |
| May       | 43705                      |               |
| June      | 52064                      |               |
| July      | 32779                      |               |
| August    | 27364                      |               |
| September | 12141                      |               |
| October   | 11353                      |               |
| November  | 10349                      |               |
| December  | 9557                       |               |

*NOTE:* Non-powered dams (NPD) are those that do not produce electricity but provide services ranging from water supply to inland navigation and other water conveyance infrastructures such as irrigation canals. Estimates factor technical characteristics described in the Department of Energy/Oak Ridge National Laboratory [Assessment of Energy Potential at Non-Powered Dams in the United States report](#).

# SLOPE: Renewable Energy Technologies Considered

| Metric          | Description  | Indicator   |
|-----------------|--|---|
| Commercial PV*  | Uses commercial and industrial building roof-mounted, fixed tilt, medium-capacity systems to convert solar energy into electricity                                     | Technical generation potential, levelized cost of energy (LCOE); quintiles based on national data |
| Residential PV  | Uses residential building roof-mounted, fixed tilt, small-capacity systems to convert solar energy into electricity  | Technical generation potential, LCOE; quintiles based on national data                            |
| Utility PV      | Uses ground-mounted, tracking, large-capacity systems to convert solar energy into electricity   | Technical generation potential, LCOE; quintiles based on national data                            |
| Land-based wind | Uses utility-scale, large-capacity onshore wind turbines to convert energy from wind spinning the turbine blades into electricity                                      | Technical generation potential, LCOE; quintiles based on national data                            |
| Geothermal      | Converts energy from naturally occurring underground reservoirs of hot water spinning a turbine into electricity   | LCOE, capital costs; quintiles based on national data   |
| Hydropower      | Converts potential energy from flowing water into electricity; costs consider development of new stream reach and non-powered dams—not upgrades to existing facilities | LCOE, capital costs; quintiles based on national data   |

\*Photovoltaics

# REopt: Solar-Plus-Storage

| Metric             | Description                                  | Indicator  |
|--------------------|--|--|
| Solar-plus-storage | Battery energy storage systems with solar PV | Cost savings estimates reaggregated* from utility subdivisions to county-level |

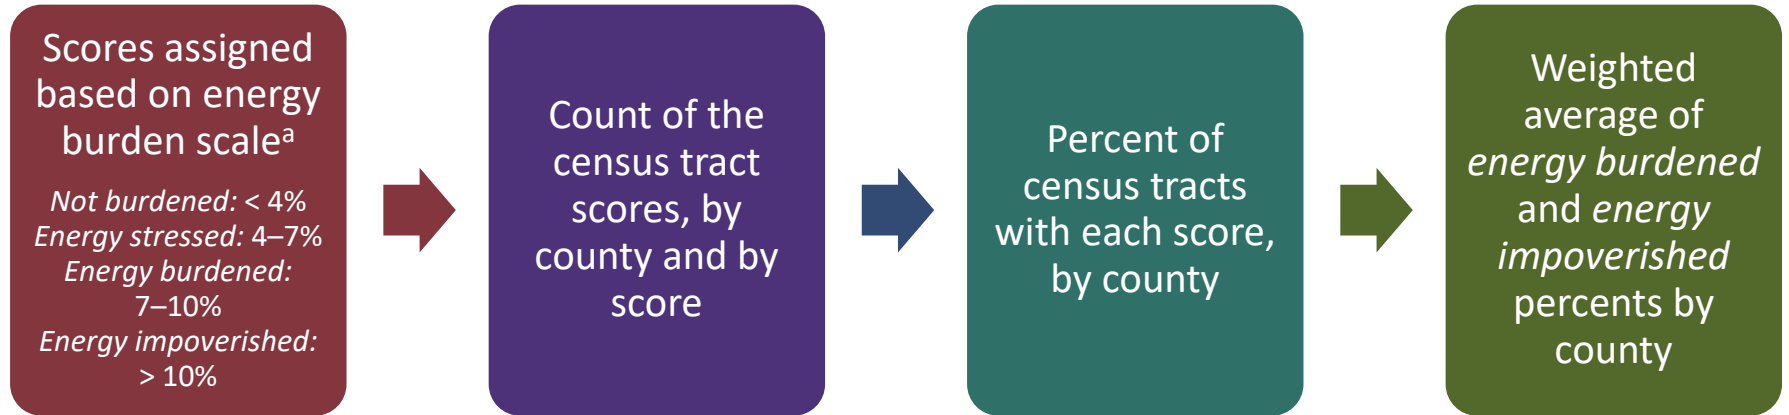

\*Reaggregation occurred by intersecting REopt data with US county shapefiles & calculating percent overlap between reference sites and counties and scaling the cost savings for each site within the county by percent overlap

# LEAD: Energy Burden

| Metric        | Description   | Indicator   |
|---------------|---|---|
| Energy burden | % of household income spent on household energy use | Weighted average of energy burdened and energy impoverished percents by county* |

\**Energy burdened* defined as an energy burden of  $\geq 7\%$  and  $\leq 10\%$ ; *energy impoverished* defined as an energy burden of  $> 10\%$  (Cook & Shah, 2018).

<sup>a</sup>Cook & Shah, 2018

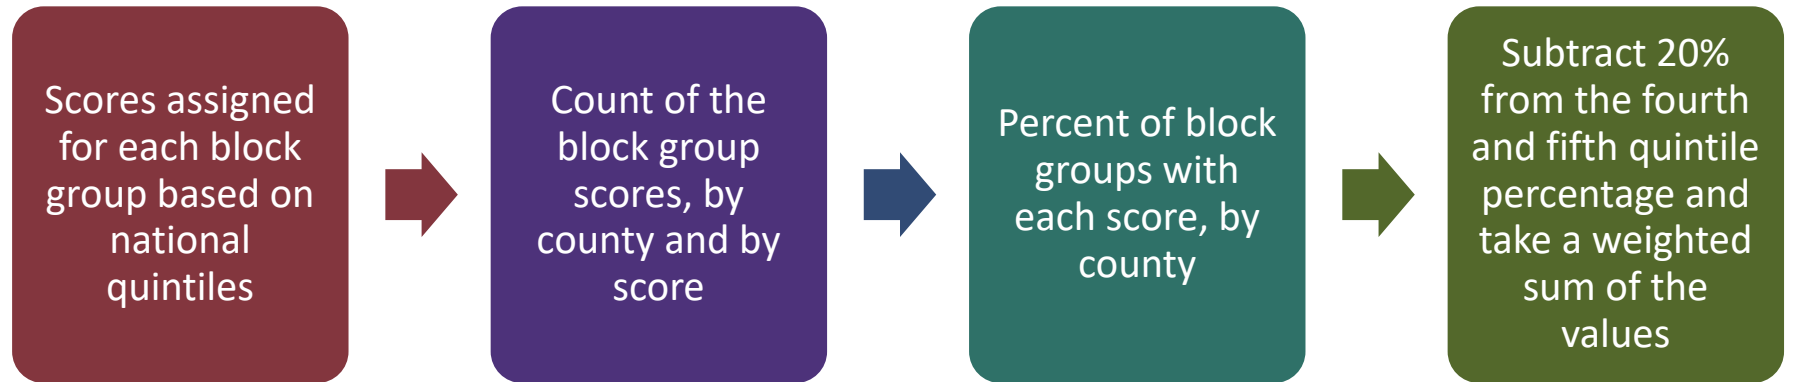

# Rural Atlas: Sociodemographic Indicators

| Metric                                | Description  | Indicator                                    |
|---------------------------------------|--|--|
| Mining, quarrying, and oil & gas jobs | % of labor force employed in mining, quarrying, and oil & gas extraction | Quintile based on national data              |
| Rural-urban code                      | Rural-urban classifications  | Ranges from 1 (most urban) to 9 (most rural) |
| Unemployment                          | % of unemployed individuals  | Quintile based on national data              |

# EJSCREEN: Sociodemographic Indicators

| Metric       | Description   | Indicator  |
|--------------|---|--|
| Less than HS | % of individuals with less than a high school education                         | Weighted sum of proportion of block groups in the fourth and fifth quintile in excess of 20% by county |
| Low-income   | % of households that make less than or equal to twice the federal poverty level |  |
| Minority     | % of non-white, non-Hispanic/Latinx individuals                                 |  |

# EJSCREEN: Environmental Hazard Indicators

| Metric               | Description  | Indicator  |
|----------------------|--|--|
| Cancer risk          | Due to inhalation of outdoor air toxics  |  |
| Diesel PM            | Concentration of hazardous air pollutants  |  |
| Lead paint           | % of occupied housing units built before 1960  |  |
| NPL proximity        | Superfund sites where remediation is needed  |  |
| Ozone                | Concentrations from summer averages  |  |
| PM <sub>2.5</sub>    | Concentrations of fine particles in the air  |  |
| Respiratory hazard   | Due to air toxics  | Percent of block groups in the fifth quintile in excess of 20% by county |
| RMP proximity        | Facilities that house hazardous materials for which a risk management plan is needed |  |
| TSDF proximity       | Hazardous waste disposal sites   |  |
| Traffic proximity    | Average annual daily vehicle counts divided by distance                              |  |
| Wastewater discharge | Water pollutant concentrations divided by the distance                               |  |

# Initial Analyses: Broad Patterns between DACs and REs

- **Rural areas** tend to have better opportunity for **land-based wind** development.
- **Mining and oil & gas communities** tend to have better opportunity for **utility PV** and **land-based wind** development.
- **Rooftop PV** has higher potential in urban areas, areas with higher minority populations, and areas exposed to certain environmental hazards.
- **Communities with higher ozone concentrations** tend to have better opportunity for **utility, commercial, and residential PV** and for **land-based wind** development.

| Indicator                             | Technology          |         |                     |                   |                     |         |                     |                  |                   |                   |                  |                   |                   |  |

Note: Blue shades indicate positive correlations, with darker blue indicating a stronger positive correlation. Pink shades indicate negative correlations, with darker pink indicating a stronger negative correlation. The lightest shade indicates a correlation between  $\pm 0.10$  and  $\pm 0.30$ , and the darkest shade indicates a correlation greater than  $\pm 0.30$ . White indicates either a negligible correlation ( $r < .10$ ) or a correlation with  $p > .10$ . A p-value less than .05 indicates a significant relationship, and a p-value greater than or equal to .10 indicates a nonsignificant relationship. A p-value greater than or equal to .05 and less than .10 is considered marginally significant.

\*\*\* p < .001, \*\* p < .01, \* p < .05, + p < .10

*Note.* To generate this list, the data set was filtered to include only the counties with the highest score for the minority indicator. The data set was then sorted by highest unemployment rate.

## Costilla County

- **Indicators of high need**
  - Rural & farming-dependent
  - High unemployment
  - Low-income, persistent poverty, & energy burdened (7-10%)
- **Indicators of high potential**
  - Land-based wind & Utility PV
    - High technical potential
    - Low cost

## DAC and Renewable Energy Deployment Potential Indicators in Costilla County, CO

| Metric                                    | Quintile or Indicator Score | Raw value  |
|---|-----------------------------|------------|
| <b>Utility PV</b>                         |                             |            |
| Technical potential (MWh)                 | 4 <sup>th</sup>             | 91,650,546 |
| LCOE (\$/MWh)                             | 1 <sup>st</sup>             | 45         |
| <b>Land-based wind</b>                    |                             |            |
| Technical potential (MWh)                 | 4 <sup>th</sup>             | 10,961,518 |
| LCOE (\$/MWh)                             | 2 <sup>nd</sup>             | 38         |
| <b>Solar-plus-storage</b>                 |                             |            |
| Cost savings (\$)                         | 4 <sup>th</sup>             | 3,363      |
| Unemployment rate (%)                     | 4 <sup>th</sup>             | 7.2        |
| Mining, quarrying, and O&G employment (%) | 4 <sup>th</sup>             | .86        |
| Low-income                                | .88                         | -          |
| Energy burden                             | .55                         | -          |
| Less than high school education           | .93                         | -          |
| Hispanic or nonwhite individuals          | .81                         | -          |
| Ozone concentration                       | .80                         | -          |

*Note: Raw value not reported for some metrics because original resolution was not at the county level*
