

U.S. Department of Energy  
Energy Efficiency and Renewable Energy

# Overview of the 1000 MW CSP Southwest Initiative

*Mark S. Mehos*  
*National Renewable Energy Laboratory*

*July 13, 2004*

## Disclaimer and Government License

This work has been authored by Midwest Research Institute (MRI) under Contract No. DE-AC36-99GO10337 with the U.S. Department of Energy (the "DOE"). The United States Government (the "Government") retains and the publisher, by accepting the work for publication, acknowledges that the Government retains a non-exclusive, paid-up, irrevocable, worldwide license to publish or reproduce the published form of this work, or allow others to do so, for Government purposes.

Neither MRI, the DOE, the Government, nor any other agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe any privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not constitute or imply its endorsement, recommendation, or favoring by the Government or any agency thereof. The views and opinions of the authors and/or presenters expressed herein do not necessarily state or reflect those of MRI, the DOE, the Government, or any agency thereof.

In 2002, Congress asked the Department of Energy to:

*“develop and scope out an initiative to fulfill the goal of having 1000 megawatts (MW) of new parabolic trough, power tower, and dish engine solar capacity supplying the southwestern United States”*

In June 2004 the Western Governors' Association at their annual meeting in Santa Fe, resolved to diversify their energy resources by developing 30GW of clean energy in the West\*, including a declaration to:

*“establish a stakeholder working group to develop options for consideration by the Governors in furtherance of the 1,000 MW initiative”*

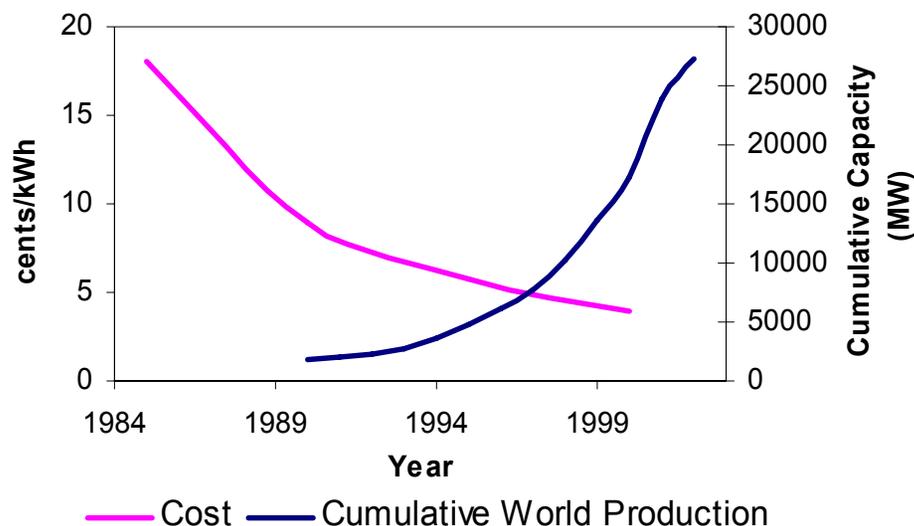

- CSP Costs – Why should the states be interested?
- CSP Potential – Where could 1000MWs be sited?
- CSP Benefits – What will the states get for it?

# CSP Costs Will Decline

Cost reductions realized by wind power are good examples for CSP.

Wind Power Costs and Capacity

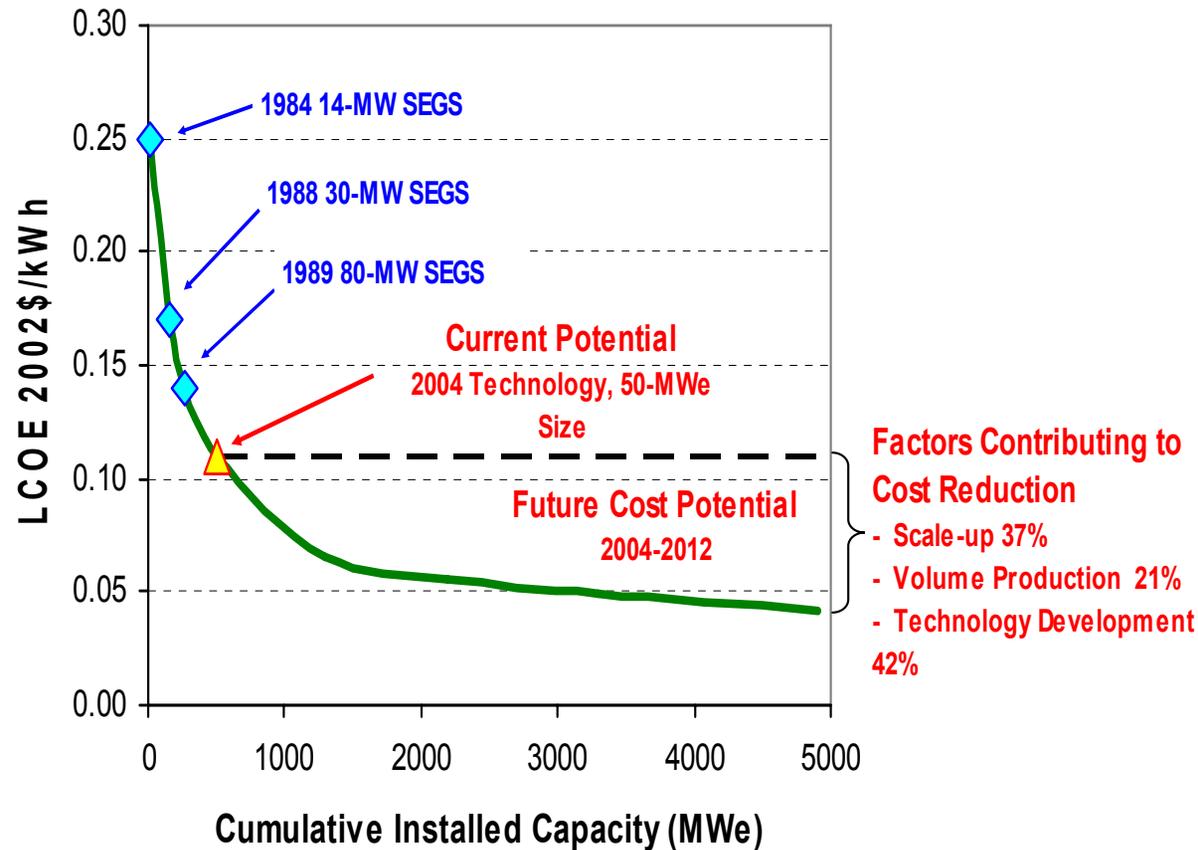

**Initial cost of wind power was high but decreased as installed capacity increased.**

**The same trend will occur for CSP.**

# Projected Costs of CSP Generation

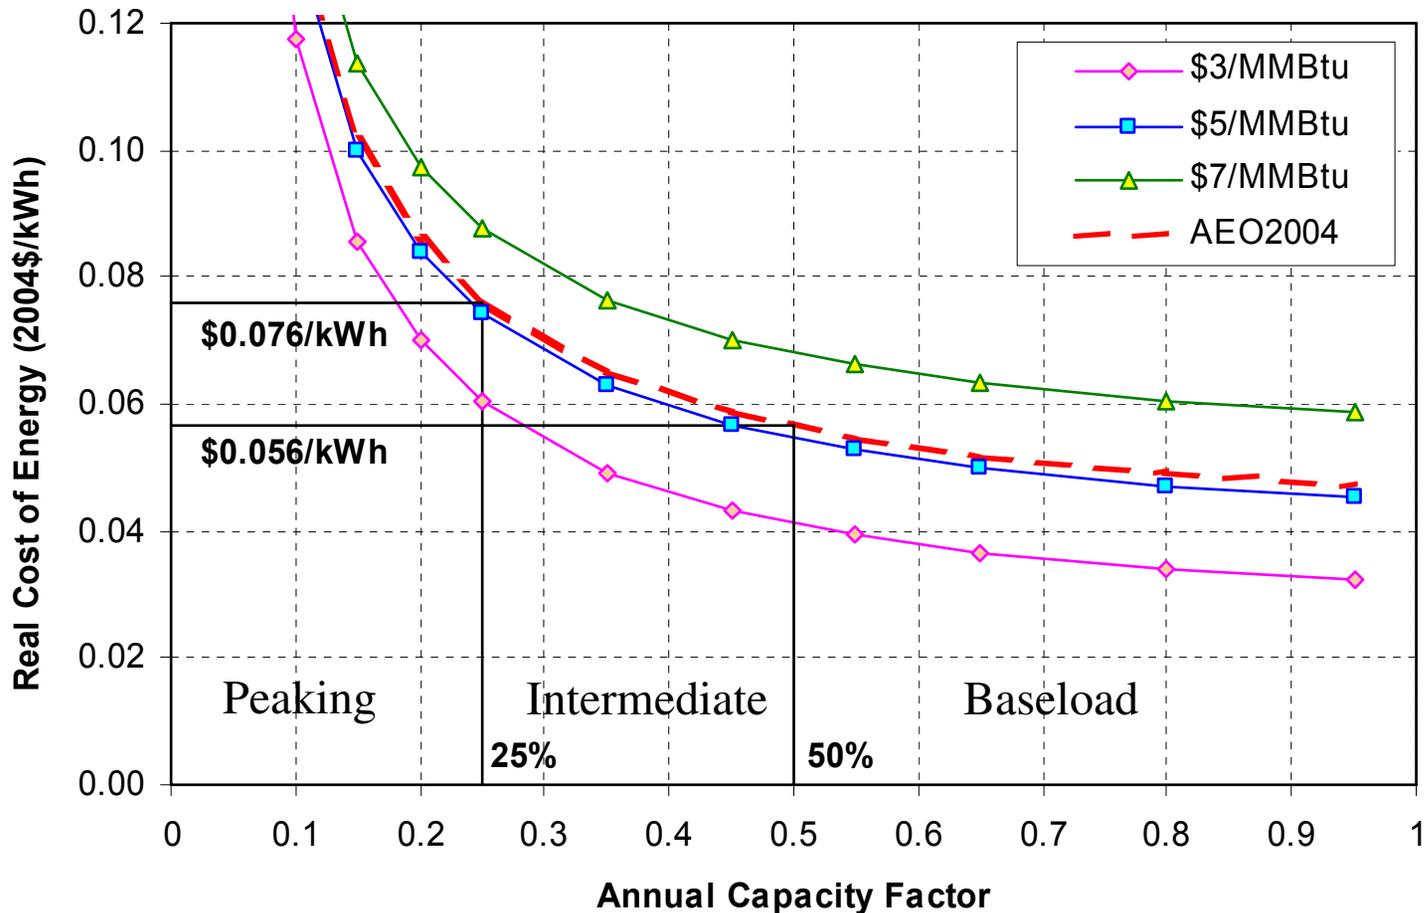

- Sargent & Lundy\* and NREL/Sandia each evaluated the potential cost reductions of CSP.
- Cost reductions for trough technology will result from deployment, scale and R&D
- Cost reductions are accelerated with faster deployment schedule

Pilkinton Solar International, 1996..

# Southwest Solar Resources: Which Locations Are Suitable for Development?

All Solar Resources

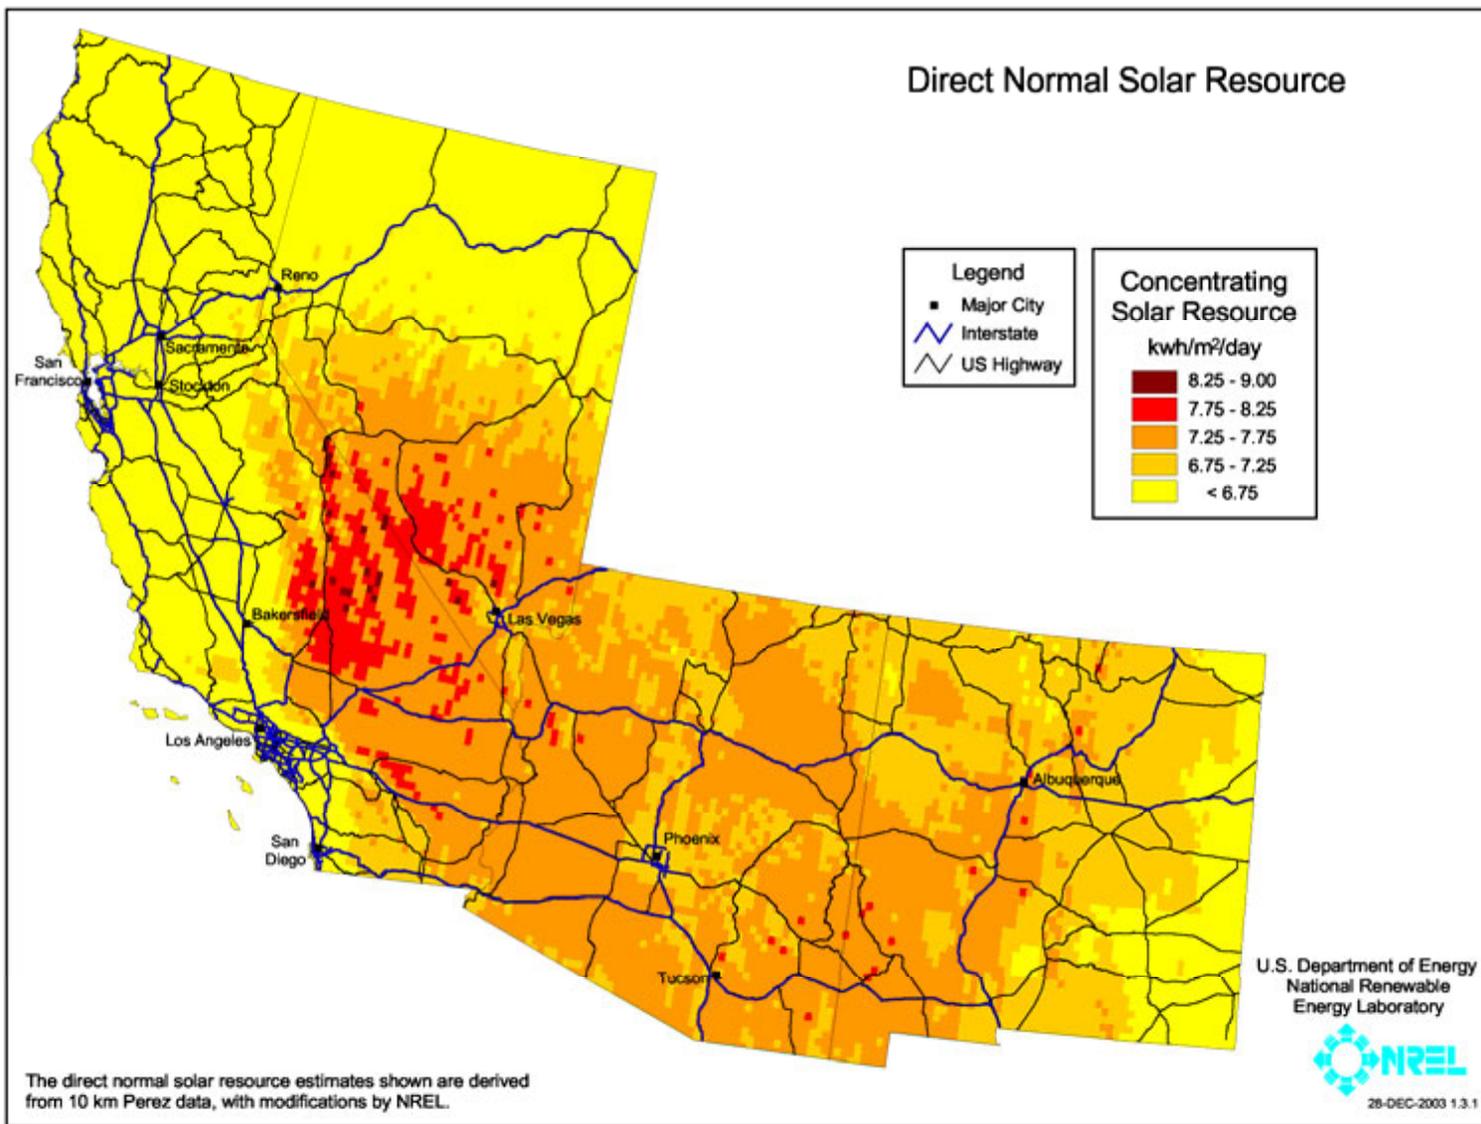

Locations Suitable for  
Development

1. Start with direct normal solar resource estimates derived from 10 km satellite data.
2. Eliminate locations with less than 6.75 kwh/m<sup>2</sup>/day.
3. Exclude environmentally sensitive lands, major urban areas, and water features.
4. Remove land areas with greater than 1% (and 3%) average land slope
5. Eliminate areas with a minimum contiguous area of less than 10 square kilometers.

# 4-State Resource/GIS Analysis

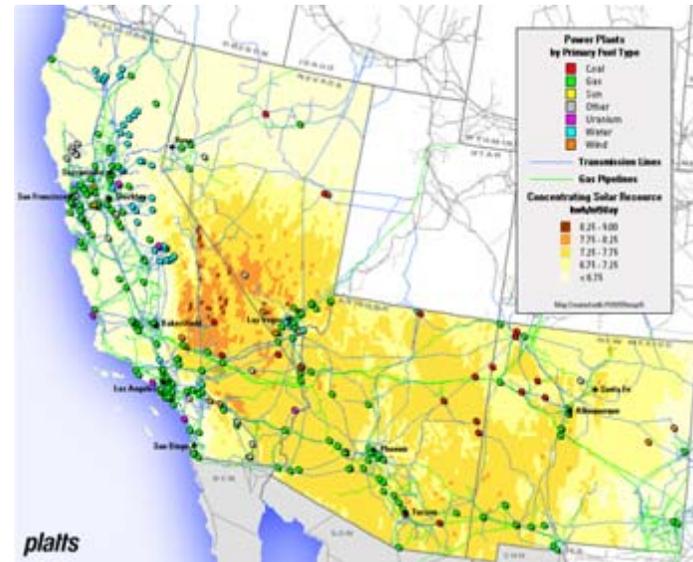

# New Mexico Proposed Regions

# Energy Benefits - SW Solar Energy Potential

State	Solar Capacity (MW)	Land Area (Sq Mi)
AZ	3,267,456	25,527
CA	821,888	6,421
NV	743,296	5,807
NM	3,025,920	23,640
<b>Total</b>	<b>7,858,560</b>	<b>61,395</b>

The table and map represent land that has no primary use today, exclude land with slope > 1%, and do not count sensitive lands.

Solar Energy Resource  $\geq 7.0$  kWhr/m<sup>2</sup>/day (includes only excellent and premium resource)

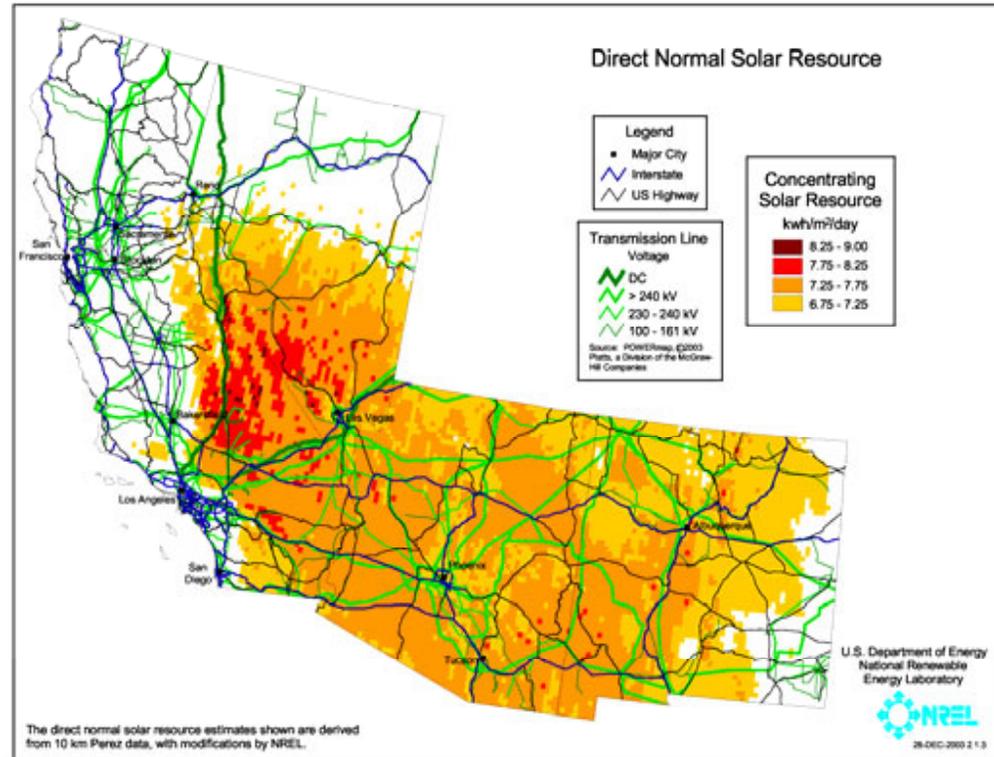

YEAR	RPS Capacity of the States				
	CA (MW)	NV (MW)	NM (MW)	AZ (MW)	Total (MW)
2008	4,343	393	129	61	4,926
2010	5,648	505	172	64	6,389
2012	5,876	627	198	68	6,769
2015	6,236	779	209	73	7,297

- Current total generation in the four states is over 100,000 MW.
- Planned additions in four states over the next 3 – 5 years are 37,099 MW of which 87.6% is natural gas.

## Large-scale deployment of CSP would:

- Help offset local transmission constraints by locating plants near load centers and away from bottlenecks.
- Provide the potential for export power to other states in the region.
- Support energy price stability by hedging against natural gas price volatility.
- Offset hydropower reductions during times of drought, a particular issue in the SW

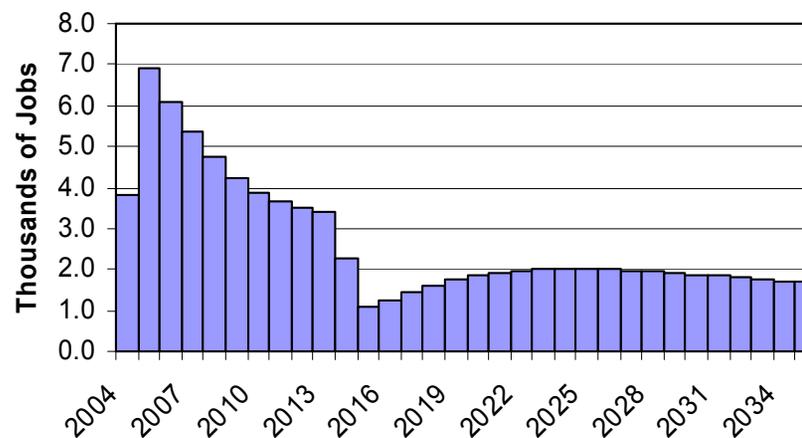

## Create New Jobs in Rural Areas

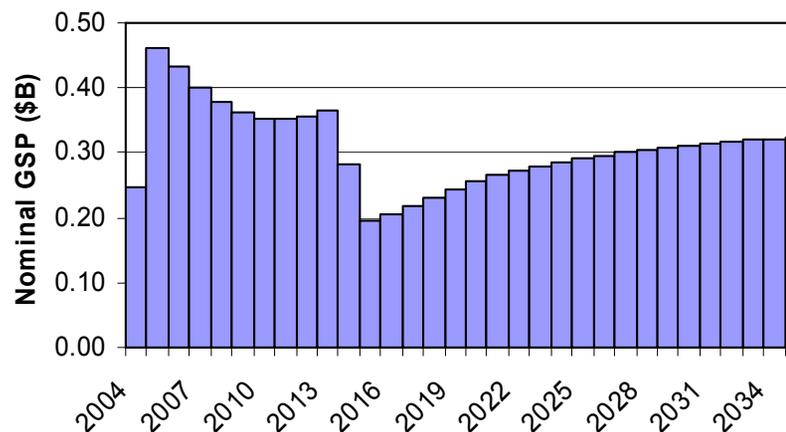

- At its peak, installation of 1000 MW of CSP power plants would create nearly 7,000 new jobs\*
- These jobs can readily be created in rural areas.
- With the location of CSP plants in the Southwest, manufacturing and assembly plants can be expected to locate in the region.

\* Based on UNLV Center for Business and Economic Research study on the potential impact of constructing and operating solar power generation facilities in Nevada.  
<http://www.nrel.gov/docs/fy04osti/35037.pdf>

### Employment Impact

### Gross State Product Impact

# Summary

- The solar energy resource in the Southwest is enormous and largely untapped.
- 1000MW of CSP capacity in the Southwest would greatly benefit the region's energy, economic, and environmental interests.
- The Western Governors' have heard this message, and are forming a stakeholder working group to develop options for furtherance of the 1000MW initiative.
