Lee Smith, and David S. Ginley

National Renewable Energy Laboratory, Golden Colorado 80401

## Objective

To develop inkjet printing (including tools, inks, and processing conditions) for high-quality Ag contacts for Si solar cells.

## Advantages of inkjet

- Non-vacuum process
- No contact between print head and substrate
- Liquid precursors
  - Good compositional control
  - Available for a variety of electronic materials
  - Multicomponent/Multi layer printing
- Efficient use of materials

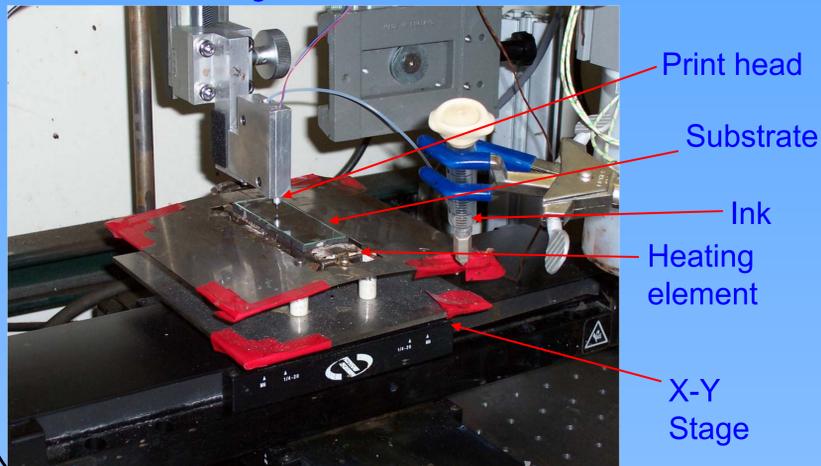

## Approach

✓ Formulate inks using nanoparticle and/or metal-organic (MO) precursors + additives (surfactants, reducing agents, etc.)

✓ Find optimal printing conditions (temperature, drop generation rate, drop volume, sample translation speed)

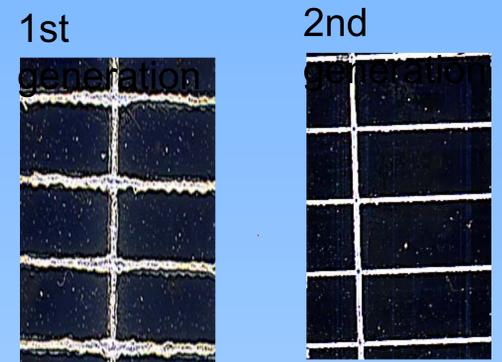

✓ Find optimal annealing conditions (temperature, duration, gas ambient)

## MicroFab Piezoelectric Inkjet Printer

## Solar Cells with Printed Contacts

	1st	2nd: Thicker contacts	3rd:Fire- Through
Line thickness:	10 $\mu\text{m}$	15 $\mu\text{m}$	15 $\mu\text{m}$
Line width:	400 $\mu\text{m}$	250 $\mu\text{m}$	220 $\mu\text{m}$
Dep. Temp. :	180°C	180°C	180°C
Ann. Temp.:	850°C	850°C	750°C
Cell efficiency	8%	8%	10%
AR-coated Si substrates from Evergreen Solar			

Spray based processing has produced a 12% efficient cell

## Ag Printing with MO Ink

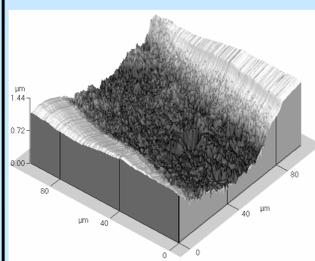

**Ink:** MO Ag complex + solvent + surfactant, 25% Ag by weight loading

- Ag Deposition rate: 1  $\mu\text{m}/\text{pass}$
- Substrate temp: 180°C
- Resolution: 85  $\mu\text{m}$  for 1  $\mu\text{m}$  thick line, 220  $\mu\text{m}$  for 15  $\mu\text{m}$  thick line
- Resistivity: 2.2  $\mu\Omega\cdot\text{cm}$  (1.6  $\mu\Omega\cdot\text{cm}$  for bulk Ag) Screen Printing produces 10-20  $\mu\Omega\cdot\text{cm}$  after firing

## Lowering the Processing Temperature: Layered Printing of a "Fire-Through" Agent

Ag ink alone fires through the  $\text{Si}_3\text{N}_4$  AR coating at 850°C to give 8% efficient cells  
MO "fire-through" ink was developed to facilitate penetration of  $\text{Si}_3\text{N}_4$  layer

AFM of 1  $\mu\text{m}$  deep, 70  $\mu\text{m}$  wide trench produced by inkjet-printed "fire-through" agent onto an AR-coated Si wafer processed at 650-750°C.

## Summary

- Tools and inks for the atmospheric inkjet printing of Ag metallization for Si solar cells have been developed.
- Line widths, conductivities and thicknesses comparable to, or better than, those produced by screen printing.
- A new fire-through ink and layered printing were found to decrease the processing temperature for contact formation to as low as 650°C and improve printed cell performance.
- Future work: Improve resolution of printed lines, optimize fire-through layer thickness, processing time and temperature for best contacts.
