

Advanced Biofuels Developments in the USA

Bioenergy Australia 2010 Conference

Manly, Sydney, Australia

James D. McMillan jim.mcmillan@nrel.gov

December 9, 2010

NREL/PR-5100-51129

NREL is a national laboratory of the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, operated by the Alliance for Sustainable Energy, LLC.

Outline

Current Situation

- Biofuels progress and drivers
- New initiatives
- RDD&D situation

NREL R&D Progress

- Biochemical cellulosic ethanol and mixed alcohols
- Improved piloting facilities
- R&D beyond cellulosic alcohols
 - National Advanced Biofuels Consortium (NABC)

Outlook and Final Thoughts

-On-going challenges and unresolved issues

Recent History of Advanced Biofuels

- 1995-2000: Demonstrate technical feasibility Focus on cellulosic ethanol
- 2000-2005: Show economic feasibility & scale potential Focus remains largely on cellulosic ethanol (BC route) and mixed alcohols (TC route)
- 2005-2010: Increase funding to accelerate biofuels RDD&D Expand product portfolio to encompass higher alcohols and hydrocarbon fuels
 Begin funding research to evaluate and prove out new concepts including hybrid BC/TC and algal pathways

Current Situation

Advanced biofuels R&D booming

- Many potential routes being rigorously studied (BC, TC, hybrid, algae, etc.)
- Major bioenergy research centers formed, actively engaged (BESC, JBEI, GLBRC, EBI, etc.)
- R&D community 100x larger
- **Commercialization starting**
 - Many dozens of companies pursuing technology development
 - Cellulosic and algal biofuels production occurring, albeit at a pace much slower than planned or initially forecasted

Danish fueling station pump dispensing E5 gasoline-ethanol blend containing wheat straw-derived cellulosic ethanol

Drivers for Advanced Biofuels Remain Strong

"Developing the next generation of biofuels is key to our effort to end our dependence on foreign oil and address the climate crisis – while creating millions of new jobs that can't be outsourced. With American investment and ingenuity – and resources grown right here at home – we can lead the way toward a new green energy economy." – United States Secretary of Energy Steven Chu

Science and Discovery

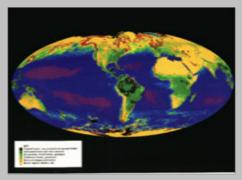

Economic Prosperity

Clean, Secure Energy

Climate Change

More Fuels Needed to Displace Fossil Oil

Products Made from a Barrel of Crude Oil (Gallons)

Other Distillates (heating oil) - 1.38 Diesel - 10.31 Heavy Fuel Oil Jet Fuel - 4.0 (Residual) - 1.68 Other Products - 7.01 Liquefied Petroleum Gases (LPG) - 1.72 Gasoline - 18.56

- Advanced biofuels and products are needed to displace the entire barrel 14.7 mbd = 225 bgy = ~850 bly 70% of U.S. petroleum use
- < Heavy duty/diesel and jet fuel substitutes required to displace several components Diesel: 43 bgy = ~160 bly Aviation fuel: 25 bgy = ~95 bly Fuel oil for ships: 10 bgy = ~ 38 bly Total: 78 bgy = ~ 295 bly 36% of transportation fuel
- < Cellulosic ethanol displaces light duty gasoline fraction 140 bgy = ~ 530 bly 64% of transportation fuel

Success Requires Functioning Supply Chain

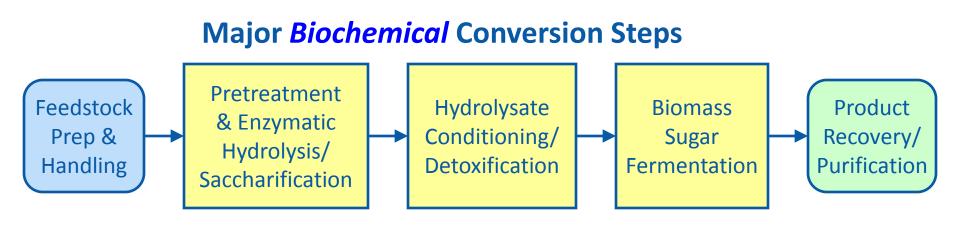

The USDOE Biomass Program is working to advance biomass technologies in support of its mission to strengthen America's energy security, environmental quality, and economic vitality through:

		Alle		- Ann attan	
Feedstocks	Conversion technologies	Integrated biorefineries	Infrastructure	Biopower	Advanced biofuels
Developing lower cost feedstock logistics systems	Improving conversion efficiencies and costs	Systematically validating and deploying technology at first-of-a-kind facilities	Evaluating vehicle emissions, performance, and deployment options	Providing a clean, domestic, dispatchable renewable source of power	Expanding portfolio beyond cellulosic ethanol to hydrocarbon fuels

Integrated Biorefinery Conversion Platforms

Biomass Conversion to Fuels

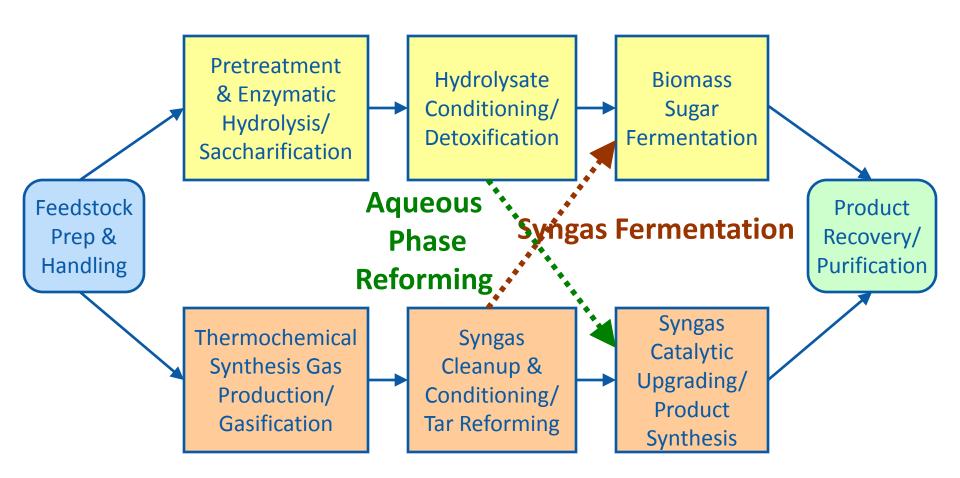

Major Thermochemical Conversion Steps

NATIONAL RENEWABLE ENERGY LABORATORY

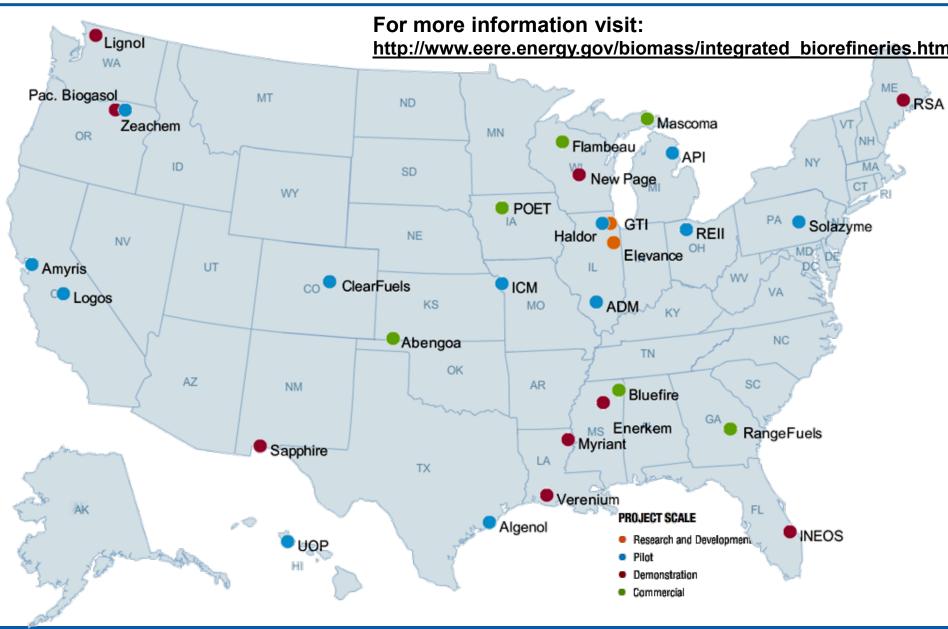

Biomass Conversion to Fuels Hybrid Approaches

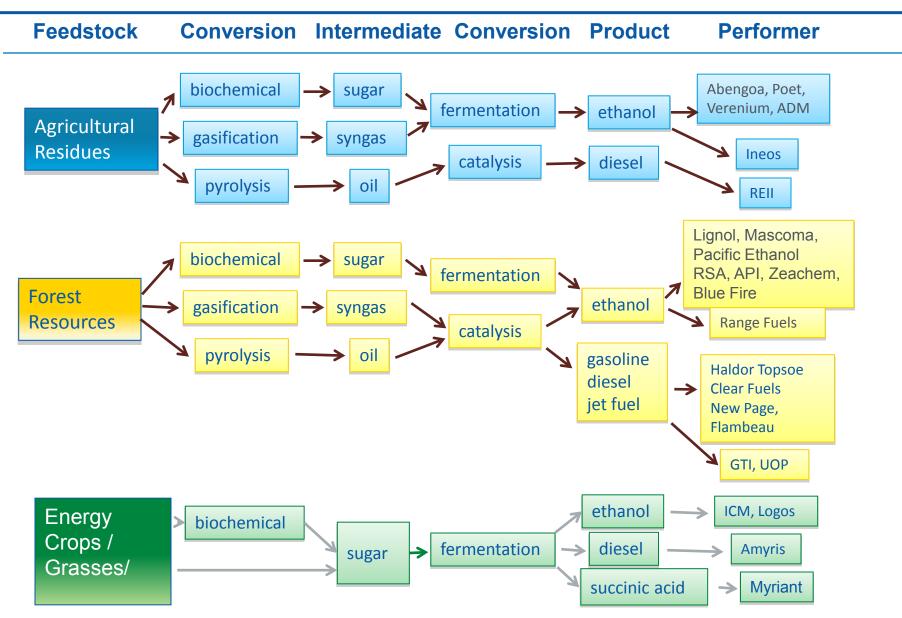

Integrated Biorefinery Projects

Scale	Description	Feedstocks	Fuel/Product	
R&D 2 projects	Includes R&D and a preliminary engineering design	Poultry Fat, Woody Biomass, Ag Residue, Algal Oil	Renewable Fuels, Renewable Gasoline, Renewable Diesel	्रतन
Pilot Scale 12 projects	Process a minimum of 1 dry ton per day biomass and verify integrated performance of the given suite of technologies from both a technical and an economic perspective for the first time	Algae, CO _{2,} Woody Biomass, Sweet Sorghum, Corn Stover, Switchgrass, Energy Sorghum, Ag and Forestry Residue, Hybrid Poplar	Ethanol, Cellulosic Ethanol, Renewable Diesel, Jet Fuel, Renewable Diesel	
Demonstration Scale 9 projects	Validate process technology performance from both technical and an economic perspectives at a scale predictive of a commercial facility	Wheat Straw, Corn Stover, Poplar Residues, Woody Biomass, Algae, Mill Residues, MSW, Ag and Forestry Residue	Cellulosic Ethanol, Renewable Sulfur-free Diesel Fuel, Renewable Hydrocarbon-based Fuel, Renewable Gasoline, Renewable Diesel, Jet Fuel, Succinic Acid	
Commercial Scale 6 projects	Process a minimum of 700 dry tons per day biomass in a a first-of-a-kind or "beta" commercial facility	Lignocellulosic Biomass, Corn Cobs, Woody Biomass, Mill Waste, Sorted MSW	Cellulosic Ethanol, Ethanol, Methanol	

DOE's Integrated Biorefinery Project Map

Integrated Biorefinery Projects, cont'd.

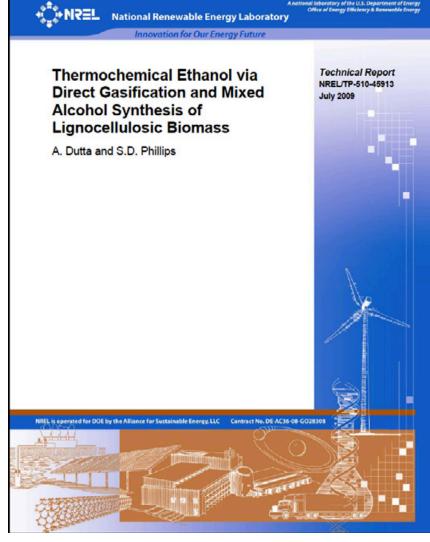

Progress at NREL

Cellulosic Ethanol/Mixed Alcohols Progressing

New Facilities Coming On-line (TCPDU and IBRF)

New Initiatives Underway (BESC and NABC)

NREL BC and TC Design Reports

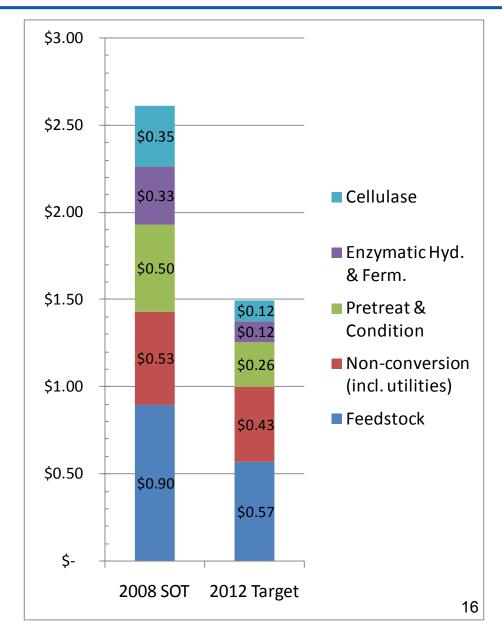

BC: http://www.nrel.gov/biomass/pdfs/32438.pdf TC: http://www.nrel.gov/biomass/pdfs/45913.pdf Document probable BC and TC routes to costeffective cellulosic ethanol/mixed alcohols
 Nominal 2012 "target" cases
 Updated BC design report will publish in 2011

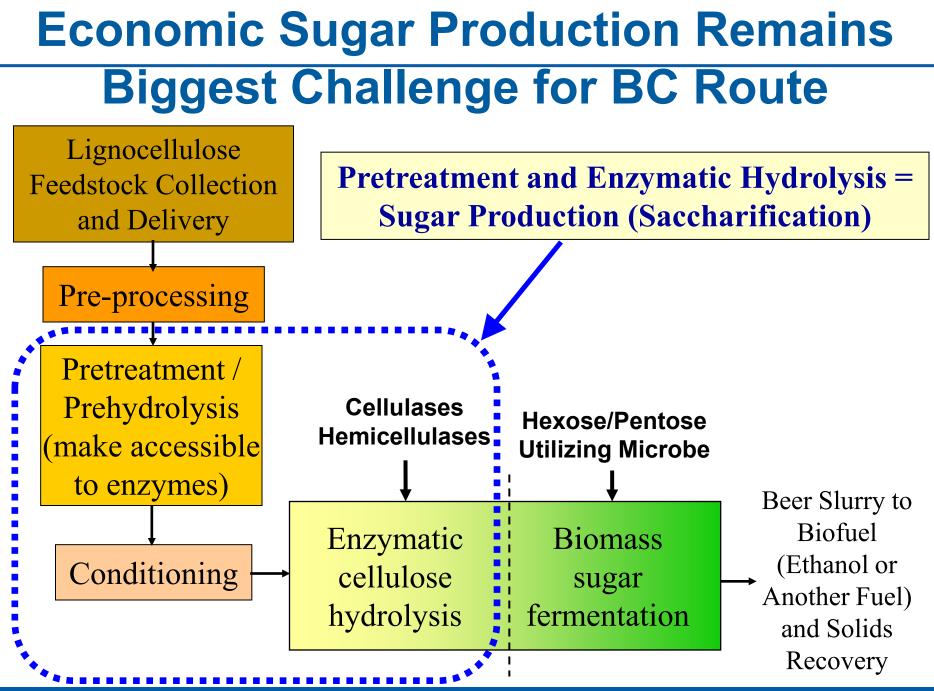

- •Establishes bases for comparison of other technology options (with clearly stated assumptions and referenced source data)
- *Rigorous models to help quantify the R&D targets needed to achieve cost targets*
- •Enables impact of research progress to economic / cost goals to be quantified
- Transparency facilitates dialogue and collaboration with industry
- Have undergone extensive peer review by industry, academia and government

Achieving Economic Feasibility (BC)

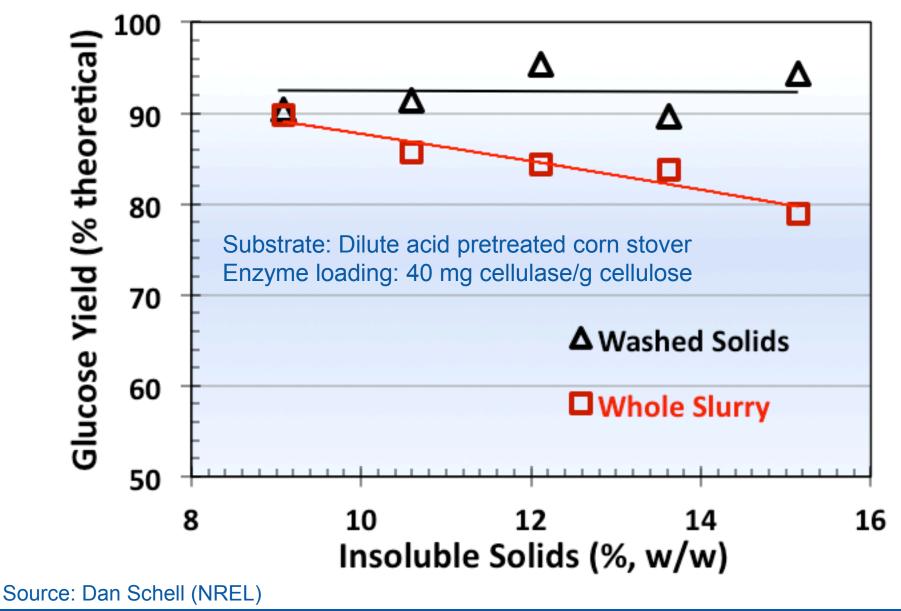

Process cost drivers

- → Yield > Conc > Rate
- Feedstock
- Capital equipment
 - Pretreatment
 - Enzyme Production
 - Distillation
 - Boiler/CHP
- Operating cost
- Coproduct value
- → Reduce CAPEX through co-location and process intensification

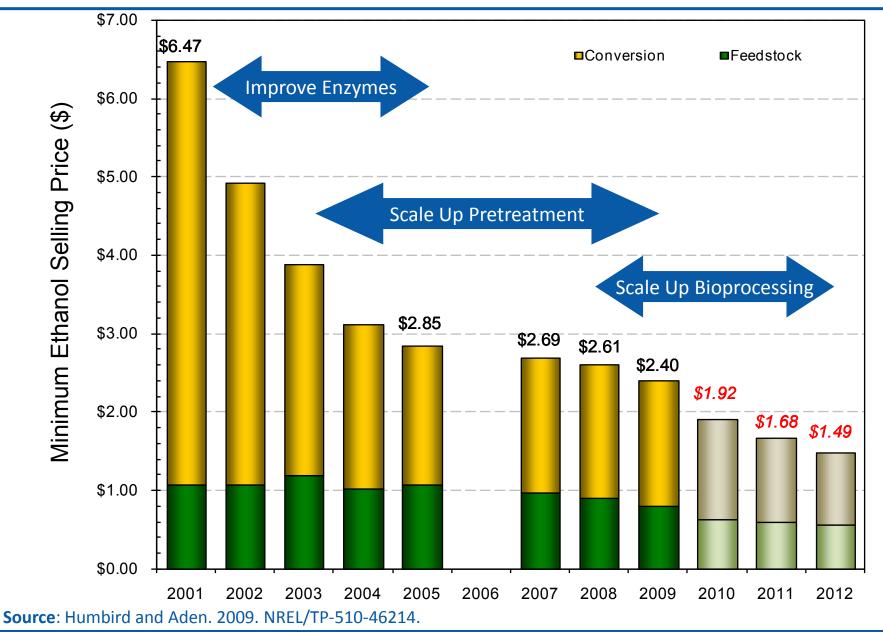

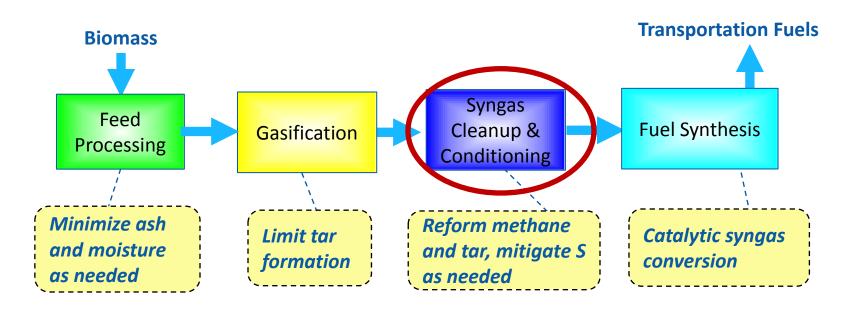

Intensifying Enzymatic Hydrolysis

Biochemical Technology Progress (2007\$)

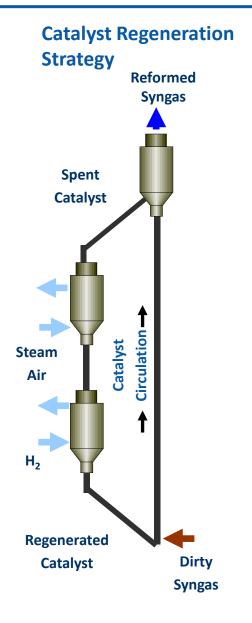

TC Focus: Clean Up and Conditioning

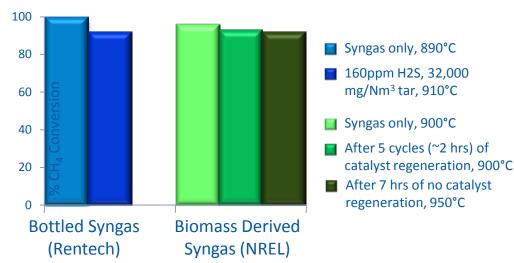

Pathway to 2012 Cost Target:

- Demonstrate continuous CH₄ reforming at >80% conversion
- Improve catalyst performance by 10-20% productivity and/or selectivity
- Better use of waste heat for drying of biomass
- Rigorous optimization of fuels synthesis operating conditions

Achieving Methane Reforming Targets

Methane Conversion During Continuous Regeneration

- 2009 Industrial collaborator demonstrated > 92% CH₄ conversion under regenerating conditions after 100 hrs using spiked bottled syngas
- 2010 NREL demonstrated > 90% CH₄ conversion after multiple regeneration cycles (~2 hrs) and >90% CH₄ conversion with no regeneration (~7hrs) - 2010
- > 2011-2012

Determine optimum regeneration strategy at scale Test tar reforming catalysts from 3 industrial partners

Johnson-Matthey, NexTech and Sud Chemie

Integrated Biorefinery Research Facility(IBRF)

NREL's Expanded BC Pilot Plant (IBRF)

- State of the art cellulosic biofuels piloting facility
- Two (2) parallel processing trains for pretreatment and primary enzymatic liquefaction
- Accelerate cost reduction focused R&D
- Provide multiple biomass pretreatment/feedstock options for RD&D support (unparalleled flexibility)
- Greatly improve industry partnering capabilities to speed scale up and commercial deployment
- DOE'S prime facility for future pilot scale pretreatment and enzymatic saccharification R&D

Biofuels for Advancing America

NABC: For Open Distribution

Outlook and Final Thoughts

Outlook for 2011-2015

 1990-2000: Demonstrate technical feasibility Focus on cellulosic ethanol 2001-2005: Show economic feasibility & scale potential Focus remains largely on cellulosic ethanol 2006-2010: Increase funding to accelerate biofuels RDD&D Expand RDD&D portfolio to higher alcohols and hydrocarbons Begin funding new concepts including hybrid **BC/TC** and algal pathways 2011-2015: Prove out and winnow advanced biofuels options

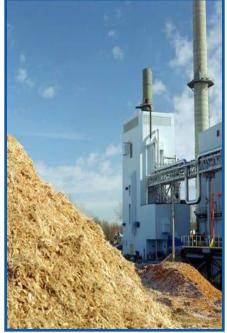

Bring first large scale demonstrations on line

Leverage Past Learnings to Succeed in Commercialization Efforts

Key to success at scale is accurately estimating cost and performance at smaller scales!

Plant cost growth strongly correlated with:

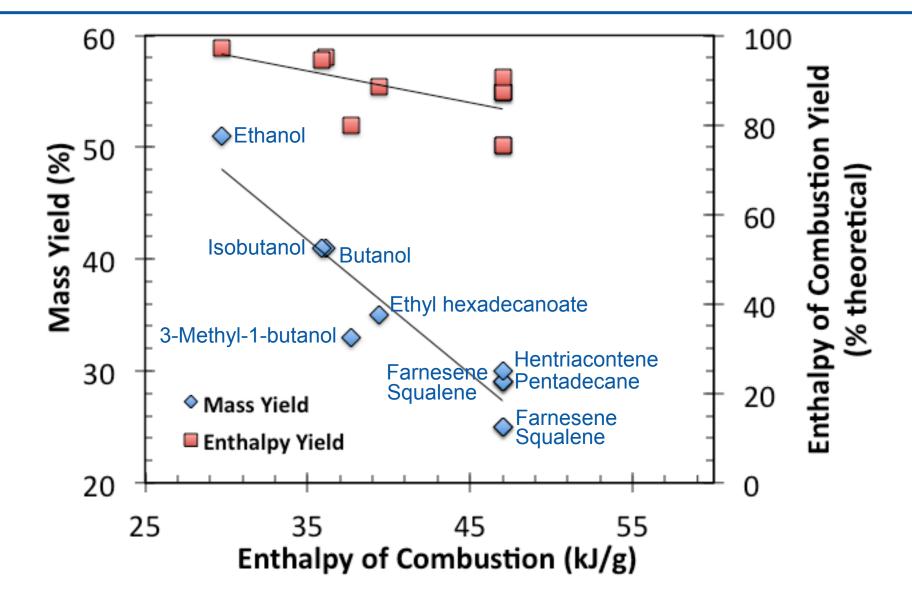

- Process understanding (*integration issues*)
- Project definition (estimate inclusiveness)
- Plant performance strongly correlated with:
 - Number of new steps
 - Percent of heat and mass balances based on data
 - Difficulty of waste handling
 - Need to process primarily solid feedstocks

These issues all apply to lignocellulose processing using new technologies. We must directly tackle them!

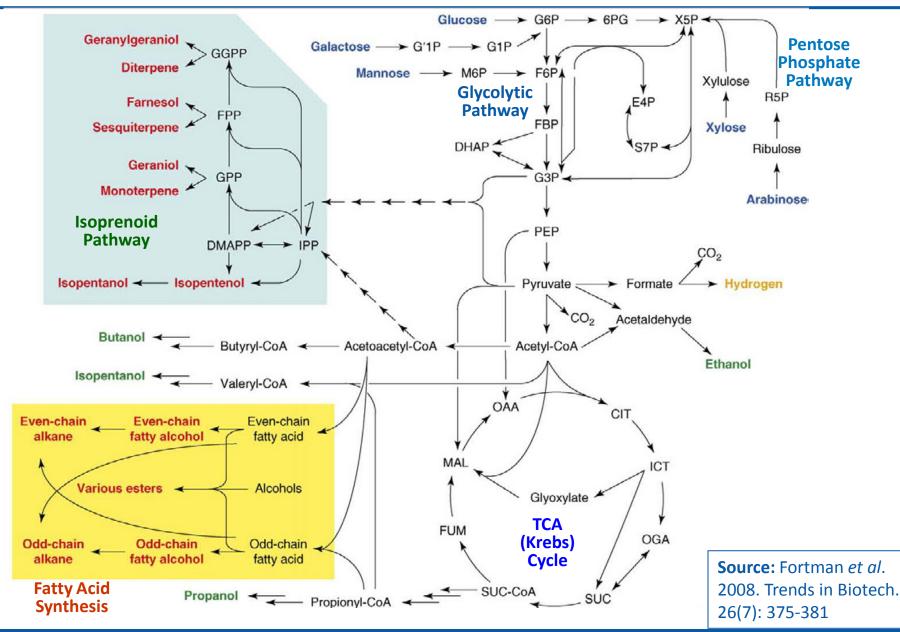

1981. Understanding Cost Growth and Performance Shortfalls in Pioneer Process Plants. 1981. Rand (for USDOE). 1985. Linking R&D to Problems Experienced in Solids Processing. Chemical Engineering Progress (May). 1988. Estimating Startup Times for Solids Processing Plants. Chemical Engineering (October).

Energy Density vs. Mass and Enthalpy Yields

Theoretical yield calculations from: Rude and Schirmer. 2009. Current Opinions in Microbiology, 12:274-281.

Anabolic vs. Catabolic Product Pathways

Final Thoughts

Lots of progress happening. Many process and product options being advanced and scaled up to pilot and demonstration scales. Commercialization beginning.

Solids handling issues and compositional analysis accuracy and throughput remain challenging technical issues limiting the pace of advanced biofuels RDD&D

Factors in play for cellulosic biofuels include:

- What pretreatment and enzymatic hydrolysis (saccharification) schemes will prove out?
- How much and how quickly will catalysts, hydrolytic enzymes and biofuels production strains be improved?
- How quickly will higher alcohols and hydrocarbons be proven at scale?

Potential game changers include:

- Price on (net) carbon, GHG emissions mitigation
- Competition for feedstocks (biopower, bioproducts)
- Production of higher value coproducts
- Price of petroleum & ethanol blend limit for non-FFVs

USA BioEnergy Atlas

http://maps.nrel.gov/bioenergyatlas

Built into Google Maps, BioEnergy Atlas includes two interactive maps, BioPower and BioFuels. These maps allow you to compare and analyze biomass feedstocks, biopower and biofuels data from the U.S. Department of Energy (DOE), U.S. Environmental Protection Agency (EPA), and the U.S. Department of Agriculture.

BioFuels Atlas is an interactive map for comparing biomass feedstocks and biofuels by location. This tool helps users select from and apply biomass data layers to a map as well as query and download biofuels and feedstock data. The state zoom function summarizes state energy use and infrastructure for traditional and bioenergy power, fuels, and resources. The tool also calculates the biofuels potential for a given area.

BioFuels Atlas was developed by the National Renewable Energy Laboratory with funding from the DOE Biomass Program.

BioPower is an interactive map for comparing biomass feedstocks and biopower by location. This tool helps users select from and apply biomass data layers to a map as well as query and download biopower and feedstock data. The analysis function offers common conversion factors that allow users to determine the potential biopower production for a selected feedstock in a specific area.

BioPower was developed by the National Renewable Energy Laboratory with funding from the EPA Blue Skyways Collaborative.
