Notes:

- 1) This analysis used modeled direct normal solar radiation estimates at a 10 km ground resolution. The resource was screened to eliminate:
 - 1) Areas with an annual average resource less than 6.00 kWh/m²/day
 - 2) Areas where slope > 1%
 - 3) Major urban areas and water features
 - 4) Areas falling within environmentally sensitive federal lands, such as national parks or wilderness areas
 - 5) Remaining areas less than 1 sq km
