$1.6 Million in Savings Identified in Anchor Assessment

Anchor Glass and its partners applied a systematic plant-wide assessment (PWA) approach to identify energy- and cost-saving opportunities at the corporation’s facilities in Warner Robins, Georgia, and Jacksonville, Florida. The team identified $1.6 million in potential annual savings; simple payback periods ranged from 1 to 2 years for the primary recommendations.

The Warner Robins and Jacksonville facilities produce glass containers. The company’s products are highly energy-intensive to fabricate. At the Warner Robins plant, typical electric loads are 12.5 megawatts, and gas loads are 4 million cubic feet per day. The smaller Jacksonville plant consumes approximately half as much energy as the Warner Robins plant. Glass production takes a great deal of energy; all personnel in each facility must be aware of energy efficiency and energy-use reduction for Anchor to remain competitive.

The assessment team considered three areas: inputs to plant processes, plant process efficiency, and process outputs, including waste and heat products. Recommendations included: recover waste heat from furnace stacks, optimize compressed air system, improve motor management and efficiency, and use variable-speed drives on pumps and blowers.

DOE funded the assessment at $100,000 and required at least a matching amount from Anchor. The table below highlights the overall savings opportunities identified.

Plant-Wide Energy Assessments

Plant-wide energy assessments (PWAs) investigate overall energy use in industrial facilities—energy use can account for 10% or more of an industry’s total operating costs. PWAs also highlight opportunities for best energy management practices for industry, including the adoption of new, efficient technologies. The Office of Energy Efficiency and Renewable Energy’s Industrial Technologies Program works with companies to identify energy-saving projects that can be replicated in other facilities and industries for multiplied savings. On average, the findings from a single assessment can be replicated multiple times—often ten times or more—at other facilities with equivalent systems and energy use. For a relatively low initial investment, companies that participate in assessments can realize a minimum of $1 million in savings annually from diminished energy costs, reduced waste, and increased productivity—usually with a payback of less than 18 months. For more information, visit www.oit.doe.gov/bestpractices/assessments.shtml.

The Industrial Technologies Program publishes a case study for each completed PWA. The case studies describe how the companies have conducted plant-wide assessments to achieve energy and cost savings, improve productivity, and reduce environmental impacts. You can help your company replicate these savings by learning about and implementing the cost- and energy-saving projects identified in these case studies. Frequently, projects can be replicated across many industries. Find out which projects could benefit your company! To learn more, visit www.oit.doe.gov/bestpractices/case_studies_pwa.shtml.

### Additional Assessment Opportunities

Small- to medium-sized manufacturers, with annual energy bills between $100,000 and $2 million, may be eligible to receive energy assessments by university-based Industrial Assessment Centers (IAC.) These IAC’s are located at 26 universities located throughout the country. Teams of engineering faculty and students from the Centers conduct energy, waste-reduction, and productivity-improvement audits, and then provide recommendations to manufacturers. Manufacturers must meet certain minimum requirements, which include appropriate manufacturing NAICS codes that fall within the energy-use range. Recommendations from industrial assessments have averaged $55,000 in potential annual savings for each manufacturer. For more information, visit www.oit.doe.gov/iac/.

**A Strong Energy Portfolio for a Strong America**

Energy efficiency and clean, renewable energy will mean a stronger economy, a cleaner environment, and greater energy independence for America. Working with a wide array of state, community, industry, and university partners, the U.S. Department of Energy’s Office of Energy Efficiency and Renewable Energy invests in a diverse portfolio of energy technologies.
