

Plant-Wide Assessment Summary — Forest Products

Industrial Technologies Program — Boosting the productivity and competitiveness of U.S. industry through improvements in energy and environmental performance

\$1.6 Million in Savings Identified in Augusta Newsprint Assessment

Augusta Newsprint and its partners conducted a systematic plant-wide assessment (PWA) to identify energy- and cost-saving opportunities at the company's plant in Augusta, Georgia. The assessment team identified \$1.6 million in potential annual savings.

The Augusta mill produces up to 440,000 metric tons of standard newsprint each year from southern pine and recycled newspaper and magazines. The assessment team's strategy focused on upgrading the energy-intensive operations through equipment modifications, byproduct recovery, and advanced control systems. The team sought opportunities to improve ease of maintenance, control, and operations, while boosting reliability, quality, and productivity. Improvements made in these areas would reduce downtime, paper breaks, and off-standard products.

The assessment team identified several energy-saving projects, including: resizing of pump impellers, adding

variable-speed motor controllers to two transfer pumps, recovering turpentine from processes and selling it, elimination of a secondary feed pump, and implementing a computer-based advanced quality control (AQC) system. The AQC system will result in the greatest savings through conservation of raw materials and electricity. The company is in the process of completing each project.

DOE funded the assessment at \$100,000 and required at least a matching amount from Augusta Newsprint. The table below highlights the overall savings opportunities identified.

Augusta Newsprint Assessment

Plant savings	\$1.6 million/year
Electrical energy savings	11 million kWh/year
Payback range for primary recommendations	4 to 15 months

Project Partners

Augusta Newsprint Company
Augusta, GA

Dean Oliver International

Honeywell Hi-Spec Solutions

ITT Industries, Goulds Pumps

Allen-Bradley Company, Inc.
(Rockwell Automation Sales)

Plant-Wide Energy Assessments

Plant-wide energy assessments (PWAs) investigate overall energy use in industrial facilities—energy use can account for 10% or more of an industry's total operating costs. PWAs also highlight opportunities for best energy management practices for industry, including the adoption of new, efficient technologies. The Office of Energy Efficiency and Renewable Energy's Industrial Technologies Program works with companies to identify energy-saving projects that can be replicated in other facilities and industries for multiplied savings. On average, the findings from a single assessment can be replicated multiple times—often ten times or more—at other facilities with equivalent systems and energy use. For a relatively low initial investment, companies that participate in assessments can realize a minimum of \$1 million in savings annually from diminished energy costs, reduced waste, and increased productivity—usually with a payback of less than 18 months. For more information, visit www.oit.doe.gov/bestpractices/assessments.shtml.

The Industrial Technologies Program publishes a case study for each completed PWA. The case studies describe how the companies have conducted plant-wide assessments to achieve energy and cost savings, improve productivity, and reduce environmental impacts. You can help your company replicate these savings by learning about and implementing the cost- and energy-saving projects identified in these case studies. Frequently, projects can be replicated across many industries. Find out which projects could benefit your company! To learn more, visit www.oit.doe.gov/bestpractices/case_studies_pwa.shtml.

Annual Savings Opportunities Identified Through Plant-Wide Energy Assessments

3M	\$1,094,000	Corning	25,920,000
Akzo Nobel	1,170,000	Equilon Enterprises	52,500,000
Alcoa (alumina production)	1,072,000	Ford	3,280,000
Alcoa (aluminum extrusion)	1,974,000	Georgia-Pacific Crossett	9,600,000
AMCAST	3,600,000	Inland Paper	9,500,000
Anchor Glass Container	1,638,000	Metlab	518,000
Appleton Paper	3,459,000	North Star Steel	2,640,000
Bayer	1,478,000	Utica Corporation	1,880,000
Boise Cascade	707,000	Weyerhaeuser Longview	3,100,000
Caraustar	1,280,000	WR Grace	840,000

Additional Assessment Opportunities

Small- to medium-sized manufacturers, with annual energy bills between \$100,000 and \$2 million, may be eligible to receive energy assessments by university-based Industrial Assessment Centers (IAC.) These IAC's are located at 26 universities located throughout the country. Teams of engineering faculty and students from the Centers conduct energy, waste-reduction, and productivity-improvement audits, and then provide recommendations to manufacturers. Manufacturers must meet certain minimum requirements, which include appropriate manufacturing NAICS codes that fall within the energy-use range. Recommendations from industrial assessments have averaged \$55,000 in potential annual savings for each manufacturer. For more information, visit www.oit.doe.gov/iac/.

A Strong Energy Portfolio for a Strong America

Energy efficiency and clean, renewable energy will mean a stronger economy, a cleaner environment, and greater energy independence for America. Working with a wide array of state, community, industry, and university partners, the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy invests in a diverse portfolio of energy technologies.
