Improve the Energy Efficiency of Fan Systems

Fan System Assessment Tool (FSAT) Saves Energy

Experience has shown that greater energy savings can be achieved through system optimization than through component optimization. The U.S. Department of Energy’s (DOE) Fan System Assessment Tool (FSAT) helps users quantify energy consumption and energy savings opportunities in industrial fan systems.

By reducing the engineering time associated with analyzing fan systems it now becomes easier to understand the economic and energy significance of changes in both system equipment and operating practices.

FSAT does not tell the user how to achieve the identified savings, but is a simple and effective tool to help users understand how well their fan systems are operating, determine the economic benefit of system modifications, and help determine which options are most economically viable when multiple opportunities exist for system modification.

With FSAT, users can:
- Determine system efficiency
- Identity degraded fans
- Collect data for trending system operation
- Examine the energy (and economic) impact of varying operating scenarios
- Quantify potential cost and energy savings

Resources
To download FSAT and other free software tools and learn more about DOE Qualified Specialists and training opportunities, visit the ITP Web site, [www.eere.energy.gov/industry/bestpractices](http://www.eere.energy.gov/industry/bestpractices).

Additionally, you can contact the EERE Information Center at 1-877-EERE-INF (1-877-337-3463), or via the Web at [www.eere.energy.gov/informationcenter](http://www.eere.energy.gov/informationcenter).

System Effects
The Air Movement and Control Association International, Inc. (AMCA) has documented that there is often a difference in performance between a tested fan configuration and an installed fan configuration. These differences are known as system effects. FSAT helps users quantify the difference between rated performance and installed performance due to such things as:

• High duct velocity
• Discharge dampers locked in position
• Obstructed inlets
• Incorrectly sized fans
• Poor duct geometry
• Degraded impellers.

Tool Description
FSAT is simple and quick to use, and requires only basic information about fans and the motors that drive them. With FSAT, users can calculate the amount of energy used by a fan system; determine system efficiency; and quantify the savings potential of an upgraded system. The tool also provides a prescreening filter to identify fan systems that are likely to offer optimization opportunities based on the system’s control, production and maintenance, and effect.

FSAT estimates the work done by the fan system and compares that to the estimated energy input into the system. Using generic typical performance characteristics for fans and motors, indications of potential savings (in energy and dollars) are developed.

Support and Training
ITP offers a 1-day workshop that highlights the benefits of fan system optimization and examines fan system performance characteristics and practical issues concerning measurement data. The session introduces the FSAT software, including how the software works, what data is required, and how to interpret assessment results. DOE has developed a Fan System Specialist Qualification as an additional level of training for industry professionals who are interested in becoming proficient in using FSAT. In addition, ITP offers an introductory 2-hour Webcast on how to use FSAT to identify energy savings opportunities. Visit ITP’s online Training Calendar for a list of upcoming sessions: www.eere.energy.gov/industry/bestpractices/events_calendar.asp.

The Fan System Assessment Tool was jointly developed by the Air Movement and Control Association International, Inc and the Oak Ridge National Laboratory for the U.S. Department of Energy’s Industrial Technologies Program

A Strong Energy Portfolio for a Strong America
Energy efficiency and clean, renewable energy will mean a stronger economy, a cleaner environment, and greater energy independence for America. Working with a wide array of state, community, industry, and university partners, the U.S. Department of Energy’s Office of Energy Efficiency and Renewable Energy invests in a diverse portfolio of energy technologies.

Prepared by NREL, a national laboratory of the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, operated by the Alliance for Sustainable Energy, LLC.

DOE/GO-102008-2724
December 2008

ITP provides U.S. industries with software assessment tools, training, technical information, and assistance. These resources and energy management practices help plants improve the energy efficiency of their process heating, steam, pumps, compressed air, and other systems; reduce operating costs; and improve their bottom line.
