Reduce NOx and Improve Energy Efficiency

NOx and Energy Assessment Tool (NxEAT) Reduces NOx and Saves Energy

The U.S. Department of Energy’s (DOE) NOx and Energy Assessment Tool (NxEAT) is available at no charge to help the petroleum refining and chemicals industries develop a cost-effective, plant-wide strategy for NOx reduction and energy efficiency improvements.

NxEAT allows the user to inventory existing equipment and study several cost-effective NOx reduction methods and energy-efficient best practices. The user starts this analysis by selecting options from a list of standard NOx-reducing methods that relate to specific types of equipment, such as fired systems, utility distribution systems, and other energy-consuming systems including pumps, blowers, and compressors.

Tool Features
- Table and Charts of NOx and energy savings
- Import data from NxEAT database
- Export your own data to the existing NxEAT database

Resources
To download the NxEAT and other free software tools and learn more about DOE Qualified Specialists and training opportunities, visit the ITP Web site, www.eere.energy.gov/industry/bestpractices.

Additionally, you can contact the EERE Information Center at 1-877-EERE-INF (1-877-337-3463), or via the Web at www.eere.energy.gov/informationcenter.

Figure 1: Opening NxEAT screen, which shows user choices such as NOx reduction analysis, energy savings analysis, reports, and data options.
Next, energy-saving options are selected for each section of the plant and, with the help of the NxEAT database, the tool uses this information to calculate NOx reduction, energy savings, and costs. The tool can then be used to generate several detailed reports that provide the annual amount of NOx reduction, the cost of the NOx-reducing options, energy savings, and comparisons of the options that were analyzed.

**Tool Description**

NxEAT provides a systematic approach to estimate NOx emissions and analyze NOx and energy reduction methods and technologies. The tool targets specific systems (e.g., fired heaters, boilers, gas turbines, and reciprocating engines) to help identify the NOx and energy savings potential associated with each option. This tool also provides useful calculators that aid in the comparisons. Outputs from the tool include:

- Profile of a plant’s current NOx emissions, energy use, and annual energy cost for NOx-generating equipment
- Calculations and comparisons of NOx emission and capital reduction for each analysis
- Energy savings analysis.

ITP provides U.S. industries with software assessment tools, training, technical information, and assistance. These resources and energy management practices help plants improve the energy efficiency of their process heating, steam, pumps, compressed air, and other systems; reduce operating costs; and improve their bottom line.
