Status and Trends in the Voluntary Market (2018 data)

Jenny Heeter, NREL
Eric O’Shaughnessy, Clean Kilowatts LLC

Presented at the Renewable Energy Markets Conference 2019
San Diego, California
4-6 September, 2019
In 2018, about **6.3 million customers** procured about **134 million MWh** of renewable energy through green power markets.

That represents about:

- **3%** of U.S. retail electricity sales
- **28%** of U.S. non-hydro renewable energy generation

Total green power sales 2010-2018 (million MWh)
## 2018 Green Power Sales and Participation

In 2018, the most voluntary sales were via unbundled RECs, while the most customers were via community choice aggregation (CCA) programs.
Voluntary Sales Increased in Each Market Segment

- **Utility Products**
  - Green Pricing
  - Utility Contracts

- **Competitive Suppliers**

- **Unbundled RECs**

- **CCAs**

- **PPAs**

- **Community Solar**
CCAs have the Largest Increase in Voluntary Market Customers

Voluntary Market
Trends by Market Segment
Utility Green Pricing

Utility green pricing programs begin with a renewable energy generator. The utility either owns the generator and retains RECs or purchases RECs from a third-party owned generator.

The utility retires the RECs on behalf of green pricing customers, who pay for the RECs through an additional line item on their utility bill.

Basic utility green pricing program structure
Specific program structures vary
About **966,000 customers** procured about **9.7 million MWh** of renewable energy through utility green pricing programs in 2018. Utility green pricing sales grew by about 9% from 2017 to 2018.
Green Pricing Programs Continue to Increase Solar Procurement

- Solar now accounts for about 19% of utility green pricing sales, up from 14% in 2017 and just 2% in 2013.
- Increasing solar procurement in green pricing programs was initially driven by the largest programs. 2018 marks the first year that solar accounts for more than 10% of green pricing sales in programs outside the top 10.
Utility Renewable Contracts

In a utility renewable contract, the customer enters into a contract with the utility to procure power and RECs from a renewable energy provider. Unlike green pricing programs, the customer may be able to specify the resource for the product.

The utility provides the power and RECs to the customer. The customer continues to pay the utility with a modified green tariff or bilateral contract rate.

**Basic utility renewable contract structure**

Specific program structures vary
About 740 MW of green power capacity had been procured through bilateral contracts through the end of 2018, generating around 2.3 million MWh of green power in 2018.
About 1,200 MW of green power capacity had been procured through utility green tariffs by the end of 2018, generating around 1.1 million MWh in 2018.
Competitive Suppliers

In restructured electricity markets, customers may choose a competitive electricity supplier that offers a green power product.

The competitive supplier provides the customer with power and RECs. The utility remains responsible for transmission and distribution. The competitive supplier may charge a premium for the green power product.

Basic competitive supplier sales structure
Specific program structures vary
About **1.7 million customers** procured about **25 million MWh** of renewable energy through competitive suppliers in 2018. Competitive supplier green power sales grew by about 38% from 2017 to 2018, largely due to increased green power sales by a single large supplier.
Unbundled REC customers purchase RECs from renewable energy providers, typically through a third-party REC marketer. The unbundled REC customer does not receive power in the transaction.

Electricity is “unbundled” from the RECs and delivered to the grid, which need not be in the same service territory as the unbundled REC customer.

Basic unbundled RECs sales structure
Specific program structures vary
Unbundled RECs Trends

About 209,000 customers procured about 63.2 million MWh of renewable energy through unbundled RECs in 2018. Unbundled REC sales grew by about 22% from 2017 to 2018.
U.S. Procurement Types are Consistent with RE100 International Trends

U.S. Total Voluntary Market

- Unbundled RECs: 20%
- Supplier products: 47%
- Direct procurement: 33%

RE100

- Unbundled RECs: 16%
- Supplier products: 46%
- Direct procurement: 35%

72 TWh (2017)

134 TWh (2018)

Note that there is some overlap between purchasers in the U.S. Market and in RE100.
Community Choice Aggregation

A CCA effectively “aggregates” the electricity demand of many customers (residential and non-residential) in order to procure electricity from an alternative supplier.

The CCA “switches” from an incumbent electricity supplier to an alternative supplier with a renewable energy product (though the switch may include a non-renewable product). The CCA purchases electricity and RECs from the alternative supplier; the utility remains responsible for transmission and distribution.

Basic CCA structure

Specific program structures vary
CCA Trends

About **3.4 million customers** procured about **9.5 million MWh** of renewable energy through CCAs in 2018. CCA green power sales grew by about 7% from 2017 to 2018.

CCAs in California

- California continues to drive increasing CCA sales and participation.
- CalCCA projects that total CCA sales will nearly double from 2018 to 2019 alone, due to the ongoing geographic expansion of CCAs into new jurisdictions.
- Unlike CCAs in other states, every California CCA offers a default electricity product with more renewable energy than required by California RPS. Most CCAs offer opt-up voluntary green power products with higher renewable energy content.
About **275 offtakers** procured about **23.5 million MWh** of green power through PPAs in 2018. PPA green power sales grew by about 19% from 2017 to 2018. These figures include only PPA sales where we estimate that the purchaser has retained the RECs.
Much of the PPA Capacity is Yet to be Commissioned

- Most PPA capacity signed in 2018 and 2019 has yet to come online, as would be expected based on standard construction cycles.
- However, some projects signed in 2015 and 2016 are also not commissioned; these projects may or may not actually be moving forward.

This figure includes projects with RECs retained by the customer or by the utility.
A typical community solar program structure begins with a shared solar array generating and feeding solar power into the grid. Most community solar arrays are owned by utilities or third-party project developers. The utility is generally responsible for crediting community solar subscribers through bill credits that reflect their ownership stake in the community solar array.

Community solar subscribers generally pay for their subscription through up-front purchases of capacity (kW) or output (kWh). In return, the subscribers receive bill credits and, in some cases, RECs. *However subscribers do not commonly receive the RECs, in which case their subscription is not a green power purchase.

**Basic community solar program structure**

Specific program structures vary
About **6,000 customers** procured about **102,000 MWh** of community solar green power in 2018.*

* Estimate is based on sales from programs that retire RECs on behalf of all subscribers. Estimate does not account for green power sales from other community solar programs where subscribers elect to purchase their RECs.
By the end of 2018, over 1.4 GWdc of community solar were installed.
- This figure includes projects with RECs retained by the customer or by the utility.

More than 2.1 GW of projects are in state interconnection queues, as of mid-2019.

While growing, community solar represents a relatively small share of total U.S. solar capacity.
- As of end 2018, community solar represented 2% of cumulative installed PV capacity
  ➢ 1.4 GW/64 GW

Community Choice Aggregation: Challenges, Opportunities, and Impacts on Renewable Energy Markets
This report explores the emergence of community choice aggregation, an energy procurement model that puts communities in control of their electricity supply. It features data on community choice aggregation voluntary green power sales and impacts on voluntary green power markets.

Existing and Potential Corporate Off-Site Renewable Procurement in the Southeast
This project assesses the market for off-site PV in the Southeast, based on projected corporate load, corporate renewable goals for load in the Southeast, solar economics relative to utility rates, presence of a viable PV purchasing method, and other factors. The project team gathered data directly and indirectly from corporations, higher education institutions, and cities and counties with renewable energy targets. State summaries are available for Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, and Tennessee.

This report explores the policy and regulatory enabling environment for corporate sourcing of renewables. The authors find that policy certainty is essential to creating vibrant markets for renewable energy, that policymakers may need to adjust policy mechanisms over time as markets go through different stages of maturity, and that policymakers must also consider the economic decisions that end users make in evaluating projects.
