

Follow-Up from the Photovoltaic Reliability Workshop (PVRW): Cost Modeling Capabilities To Evaluate Trends in PV Technologies

Jarett Zuboy, Michael Woodhouse, and Brittany Smith

Monday, May 8, 2023
DuraMAT Webinar

This work was authored by the National Renewable Energy Laboratory, operated by Alliance for Sustainable Energy, LLC, for the U.S. Department of Energy under Contract No. DE-AC36-08GO28308. Funding was provided as part of the Durable Module Materials Consortium 2 (DuraMAT 2) funded by the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Solar Energy Technologies Office, agreement number 38259.

Presentation Overview

- 1 Results from PVRW: audience polls (Jarett)**

- 2 Demonstration of Detailed Cost Analysis Models (DCAM) for technology evaluations (Mike)**

- 3 Simplified PV-LCOE calculator for reliability & cost tradeoffs in developing solar technologies (Brittany)**

- 4 Questions and discussion (All)**

Polling Results

Goals of the DuraMAT Technology Scouting Report

- Track technology changes that could affect PV module reliability
- Assess changes in module reliability risks over time
- Identify the need for new research related to reliability

“PV moves pretty fast. If you don't stop and look around once in a while, you could miss it.” – Inspired by Ferris Bueller’s Day Off

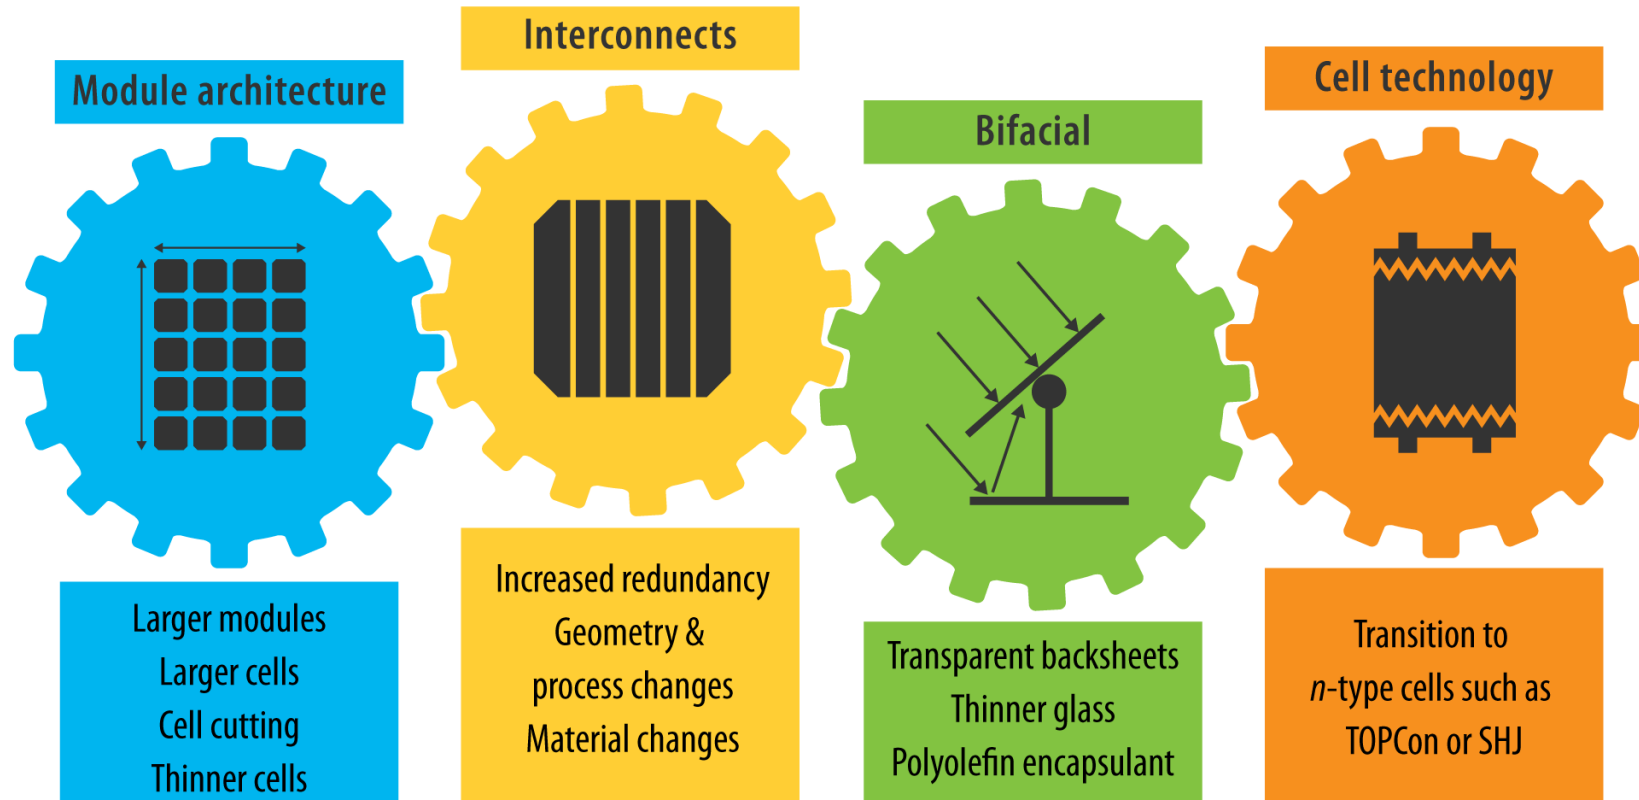

Crystalline-silicon PV module technology changes

	Typical module technology of the past	Typical recent module technology	Example emerging module technology
Trends	280 Wp 1.7 m ² 99% 0.0 18%	375 Wp 2.0 m ² 100% 0.7 22%	500+ Wp 2.5+ m ² 101+% 0.9+ 25+%
	Average module power (Wp) Module size (m ²)	Cell to module (CTM) power ratio (%) Bifaciality factor (-)	Cell efficiency (%)

Source: ITRPV 2014-2022

Categories of technology change

Example—larger modules

Historical (2021) and projected (2022–2032) ITRPV data on utility-scale module size

Drivers & Benefits

wafer/cell size

- larger cells allow for larger module sizes

increased power output

- larger active area
- improved cell-to-module (CTM) power ratio: $CTM = \frac{P_{\text{module}}}{P_{\text{cell}} \cdot n_{\text{cell}}}$

Potential Risks

potentially more frequent cell breakage due to

- weather (wind & hail), or shipping, handling, and installation

increased weight

- OSHA handling issues with very large modules; 100-lb modules may be the practical limit
- implications for mounting structure design and cost

increase in electrical current

- electrical BOS (wire size, fusing, bypass diode) must be adapted

new testing equipment necessary to accommodate large modules

- such as dynamic mechanical loading (DML) to assess hail damage and inform insurance coverage

What important module technology trends and reliability implications did we miss?

Summary—ranked categories across all questions

1. Technology (274)

- | | | |
|-------------------------------|------------------------|----------------------|
| 1. Module packaging | 6. Module architecture | 12. Circular economy |
| 2. Thin films | 7. Cells | 13. Any technology |
| 3. BOS | 8. Bifacial | 14. BIPV |
| 4. n-type silicon | 9. Not perovskites | 15. Interactions |
| 5. New materials & technology | 10. Emerging | 16. PERC |
| | 11. Mounting | 17. Interconnects |

2. Environmental (35)

3. Labor & manufacturing (25)

4. Degradation (17)

5. Politics & business (12)

6. Research & data (12)

7. Emerging applications (5)

Biggest challenges

+

Proliferating under IRA

+

Trends we missed

Biggest challenges

+

Trends we missed

Summary—top 5 individual responses to each question

Biggest reliability challenges

- New materials & technology (11)
- Extreme weather (10)
- Larger modules* (10)
- Glass, incl. thinner & heat-strengthened (8)
- Quality control (8)

Proliferating under IRA

- CdTe (25)
- TOPCon (19)
- Not perovskites (13)
- SHJ (9)
- Perovskites (8)
- Thin films* (7)

Important trends we missed

- Connectors (18)
- Junction boxes (8)
- Perovskites (5)
- Design for recyclability* (4)
- Frames* (4)
- Mounting systems* (4)
- PVSyst modeling* (4)
- Shading* (4)

* “Big floppy modules” are categorized under larger modules, but floppiness may encompass other characteristics such as glass thickness.

* Added a 6th place since “not perovskites” is not a technology per se.

* Tied for 5th place.

Summary—individual responses on more than one list

- CdTe (28)
- Connectors (20)
- Larger (possibly floppier*) modules (16)
- Perovskites (16)
- Bifacial (14)
- Extreme weather (11)
- Frames (11)
- Glass (11)
- New manufacturers (8)
- Installation (6)
- Tandems (6)
- Hail (5)
- Mounting (5)
- Racking (4)
- Recycling (4)
- Soiling (4)
- Backsheets (3)
- Diodes (3)
- High-voltage systems (2)
- Integrated applications (2)
- Non-glass substrates (2)

* Includes 9 votes for variations of “big floppy modules.”

DCAM Demo

Detailed Cost Analysis Model (DCAM): <https://dcam.openei.org/>

- Free, public, user-friendly online tool
- Enables bottom-up modeling of PV costs:
 - Manufacturing of ingots, wafers, and cells
 - Assembly of modules
 - Installation of PV systems
- Leverages NREL component and system cost benchmark research
- Can be used to analyze cost impacts of technology choices

Manufacturing Cost Modeling Structure in DCAM

Source of figure: NREL. Please see: <https://www.nrel.gov/docs/fy19osti/72134.pdf>

Manufacturing Cost Modeling Structure in DCAM

1. Direct Cost of Goods Sold

- Materials
- Labor and Utilities
- Maintenance
- Equipment and Facilities

+

2. Overhead and Profit

- Research and Development (R&D)
- Sales, General and administration (S, G, &A)
- Gross and Operating Profit
- Other Revenues and Losses (Not Included)

Factory Gate Minimum Sustainable Price (MSP)

3. Taxes and Trade Duties

- Sales, value-added or other taxes
- Customs or other import duties
- Anti-dumping and countervailing duties (AD/CVD)
- Input per source and destination

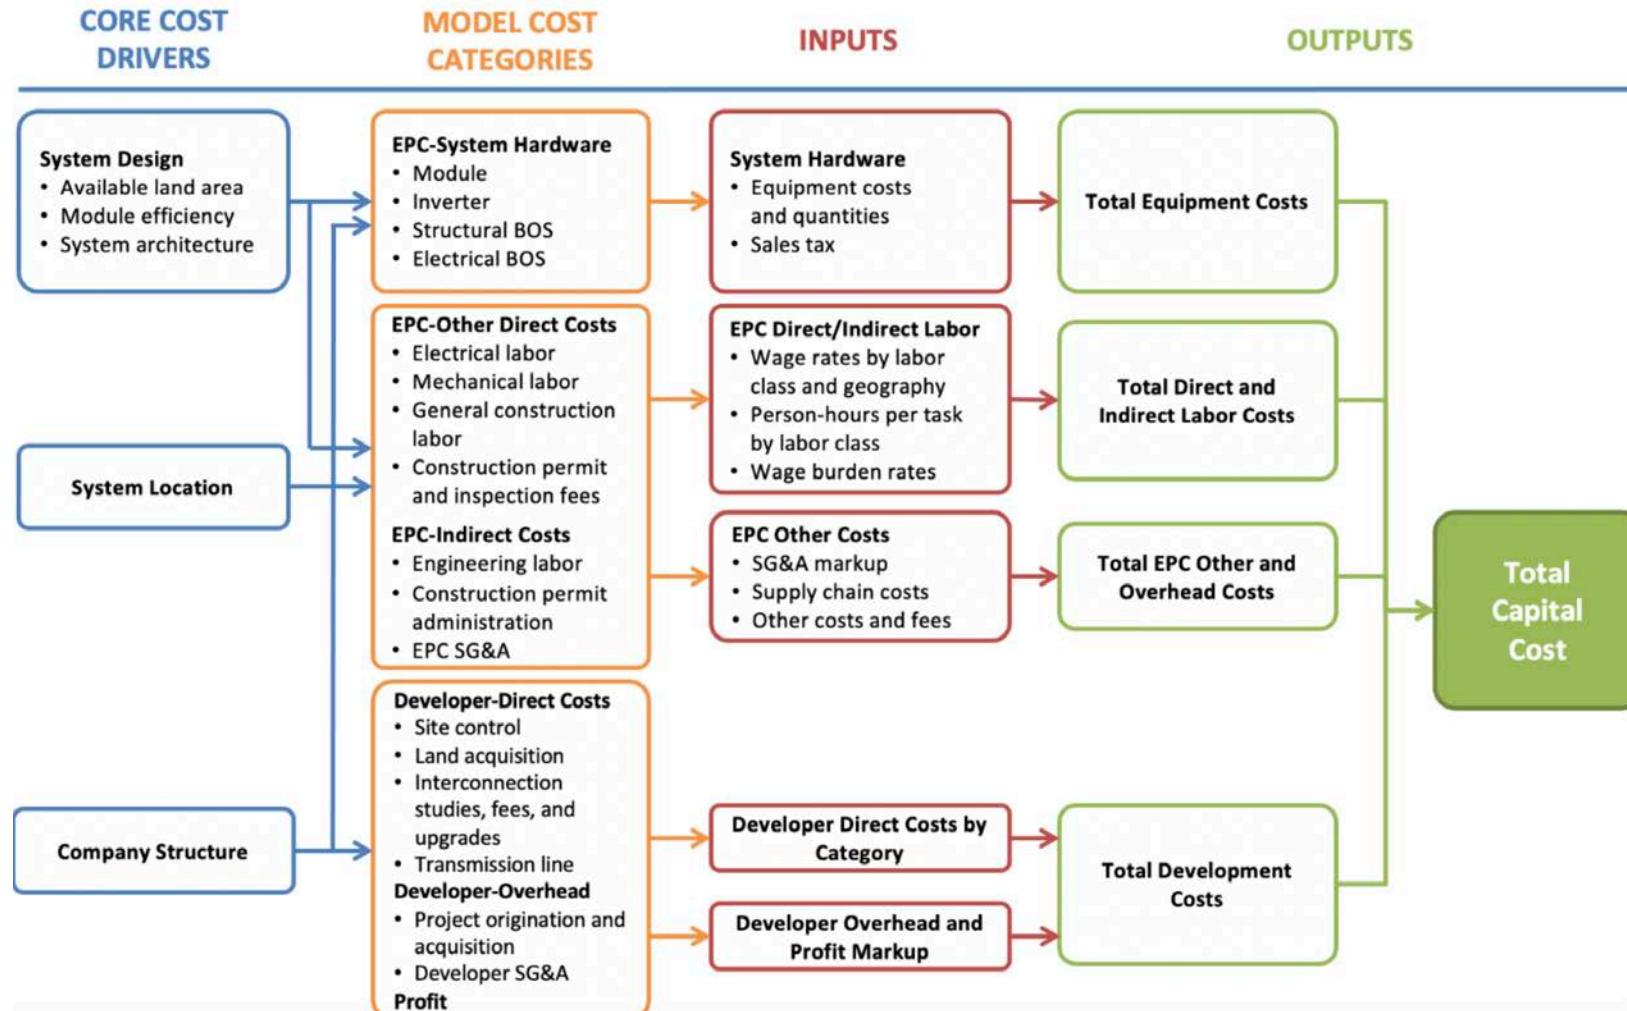

+

4. Shipping and Delivery

- Sea shipping: Modules per container and shipping container costs
- Land shipping: Miles from port to destination and cost per mile/kilometer
- Insurance, entry bond, shipping fees
- Warehouse
- Input per source and destination

Delivered Minimum Sustainable Price (MSP)

Simplified, Instant, Online
PV LCOE Calculator

Levelized Cost of Energy (LCOE)

$$\text{LCOE (\$/kWh)} = \frac{\text{Total Costs over Service Life (\$)}}{\text{Total Energy Produced over Service Life (kWh)}}$$

Simplified PV-LCOE Calculator: pvlcoe.nrel.gov

- PV technology-specific
- Editable preset fields, targeting research applications
- Instant comparison of proposed changes to a baseline system

System Advisor Model (SAM): sam.nrel.gov

- + Different financial models
- + Detailed options for module and system designs
- + Can model solar + storage

- May be more challenging for new users to navigate
- Difficult to quickly evaluate research directions without introducing confounding factors

APPLY TO BASELINE APPLY TO PROPOSED

Step 2: Default input values pre-populate, based on selections
(additional fields visible on website)

Baseline	Proposed COPY FROM BASELINE
Cost	Cost
Front layer cost (USD/m ²)	Front layer cost (USD/m ²)
3.50	3.50
Cell cost (USD/m ²)	Cell cost (USD/m ²)
22.20	22.20
Back layer cost (USD/m ²)	Back layer cost (USD/m ²)
2.40	2.40
Baseline LCOE (USD/kWh)	Proposed LCOE (USD/kWh)
0.0517	0.0517

Step 3: Results generated include LCOE, module price & system cost (not shown)

Example: What cost for improved clamps would still be competitive?

If someone designed clamps that were more secure, or easier to use, this could potentially:

- Require less installation labor
- Reduce O&M expenses (maintenance, replacements, insurance)
- Reduce degradation rate
- Increase service life
- Or all the above?

For an equal LCOE, how much more could the new clamps cost?

Step 1: Preset menu selection (leaving at defaults in this example)

Step 2: Propose cost/maintenance/performance improvements

Non-cell module cost (USD/m²)

13.60

Extra component cost (USD/m²)

0

O&M cost (USD/kW_{DC}/year)
